

DNO ASA

2024 CDP Corporate Questionnaire 2024

Word version

Important: this export excludes unanswered questions

This document is an export of your organization's CDP questionnaire response. It contains all data points for questions that are answered or in progress. There may be questions or data points that you have been requested to provide, which are missing from this document because they are currently unanswered. Please note that it is your responsibility to verify that your questionnaire response is complete prior to submission. CDP will not be liable for any failure to do so.

[Terms of disclosure for corporate questionnaire 2024 - CDP](#)

Contents

C1. Introduction.....	8
(1.1) In which language are you submitting your response?	8
(1.2) Select the currency used for all financial information disclosed throughout your response.	8
(1.3) Provide an overview and introduction to your organization.	8
(1.4) State the end date of the year for which you are reporting data. For emissions data, indicate whether you will be providing emissions data for past reporting years.....	9
(1.4.1) What is your organization’s annual revenue for the reporting period?	9
(1.5) Provide details on your reporting boundary.	9
(1.6) Does your organization have an ISIN code or another unique identifier (e.g., Ticker, CUSIP, etc.)?	10
(1.7) Select the countries/areas in which you operate.	12
(1.19) In which part of the oil and gas value chain does your organization operate?	12
(1.24) Has your organization mapped its value chain?	12
(1.24.1) Have you mapped where in your direct operations or elsewhere in your value chain plastics are produced, commercialized, used, and/or disposed of?	13
C2. Identification, assessment, and management of dependencies, impacts, risks, and opportunities	14
(2.1) How does your organization define short-, medium-, and long-term time horizons in relation to the identification, assessment, and management of your environmental dependencies, impacts, risks, and opportunities?	14
(2.2) Does your organization have a process for identifying, assessing, and managing environmental dependencies and/or impacts?	15
(2.2.1) Does your organization have a process for identifying, assessing, and managing environmental risks and/or opportunities?	16
(2.2.2) Provide details of your organization’s process for identifying, assessing, and managing environmental dependencies, impacts, risks, and/or opportunities.....	16
(2.2.7) Are the interconnections between environmental dependencies, impacts, risks and/or opportunities assessed?	20
(2.3) Have you identified priority locations across your value chain?	20
(2.4) How does your organization define substantive effects on your organization?	21
(2.5) Does your organization identify and classify potential water pollutants associated with its activities that could have a detrimental impact on water ecosystems or human health?	24
(2.5.1) Describe how your organization minimizes the adverse impacts of potential water pollutants on water ecosystems or human health associated with your activities.	25
C3. Disclosure of risks and opportunities.....	27

(3.1) Have you identified any environmental risks which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future?.....	27
(3.1.1) Provide details of the environmental risks identified which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future.	29
(3.1.2) Provide the amount and proportion of your financial metrics from the reporting year that are vulnerable to the substantive effects of environmental risks.	36
(3.2) Within each river basin, how many facilities are exposed to substantive effects of water-related risks, and what percentage of your total number of facilities does this represent?.....	37
(3.3) In the reporting year, was your organization subject to any fines, enforcement orders, and/or other penalties for water-related regulatory violations?	38
(3.5) Are any of your operations or activities regulated by a carbon pricing system (i.e. ETS, Cap & Trade or Carbon Tax)?	38
(3.5.1) Select the carbon pricing regulation(s) which impact your operations.	38
(3.5.2) Provide details of each Emissions Trading Scheme (ETS) your organization is regulated by.	39
(3.5.3) Complete the following table for each of the tax systems you are regulated by.	42
(3.5.4) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by?	42
(3.6) Have you identified any environmental opportunities which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future?	43
(3.6.1) Provide details of the environmental opportunities identified which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future.	44
(3.6.2) Provide the amount and proportion of your financial metrics in the reporting year that are aligned with the substantive effects of environmental opportunities.	50

C4. Governance 52

(4.1) Does your organization have a board of directors or an equivalent governing body?	52
(4.1.1) Is there board-level oversight of environmental issues within your organization?	53
(4.1.2) Identify the positions (do not include any names) of the individuals or committees on the board with accountability for environmental issues and provide details of the board’s oversight of environmental issues.	53
(4.2) Does your organization’s board have competency on environmental issues?	57
(4.3) Is there management-level responsibility for environmental issues within your organization?.....	58
(4.3.1) Provide the highest senior management-level positions or committees with responsibility for environmental issues (do not include the names of individuals).	59
(4.5) Do you provide monetary incentives for the management of environmental issues, including the attainment of targets?	64
(4.5.1) Provide further details on the monetary incentives provided for the management of environmental issues (do not include the names of individuals).	65
(4.6) Does your organization have an environmental policy that addresses environmental issues?.....	68
(4.6.1) Provide details of your environmental policies.	68

(4.10) Are you a signatory or member of any environmental collaborative frameworks or initiatives?	74
(4.11) In the reporting year, did your organization engage in activities that could directly or indirectly influence policy, law, or regulation that may (positively or negatively) impact the environment?	75
(4.11.2) Provide details of your indirect engagement on policy, law, or regulation that may (positively or negatively) impact the environment through trade associations or other intermediary organizations or individuals in the reporting year.	76
(4.12) Have you published information about your organization’s response to environmental issues for this reporting year in places other than your CDP response?	77
(4.12.1) Provide details on the information published about your organization’s response to environmental issues for this reporting year in places other than your CDP response. Please attach the publication.	77

C5. Business strategy..... 81

(5.1) Does your organization use scenario analysis to identify environmental outcomes?	81
(5.1.1) Provide details of the scenarios used in your organization’s scenario analysis.	82
(5.1.2) Provide details of the outcomes of your organization’s scenario analysis.	87
(5.2) Does your organization’s strategy include a climate transition plan?	88
(5.3) Have environmental risks and opportunities affected your strategy and/or financial planning?	89
(5.3.1) Describe where and how environmental risks and opportunities have affected your strategy.	89
(5.3.2) Describe where and how environmental risks and opportunities have affected your financial planning.	90
(5.4) In your organization’s financial accounting, do you identify spending/revenue that is aligned with your organization’s climate transition?	91
(5.4.1) Quantify the amount and percentage share of your spending/revenue that is aligned with your organization’s climate transition.	92
(5.4.3) Provide any additional contextual and/or verification/assurance information relevant to your organization’s taxonomy alignment.	97
(5.5) Does your organization invest in research and development (R&D) of low-carbon products or services related to your sector activities?	97
(5.5.7) Provide details of your organization's investments in low-carbon R&D for your sector activities over the last three years.	98
(5.6) Break down, by fossil fuel expansion activity, your organization’s CAPEX in the reporting year and CAPEX planned over the next 5 years.	99
(5.9) What is the trend in your organization’s water-related capital expenditure (CAPEX) and operating expenditure (OPEX) for the reporting year, and the anticipated trend for the next reporting year?	100
(5.10) Does your organization use an internal price on environmental externalities?	101
(5.10.1) Provide details of your organization’s internal price on carbon.	101
(5.11) Do you engage with your value chain on environmental issues?	104
(5.11.1) Does your organization assess and classify suppliers according to their dependencies and/or impacts on the environment?	105
(5.11.2) Does your organization prioritize which suppliers to engage with on environmental issues?	106

(5.11.5) Do your suppliers have to meet environmental requirements as part of your organization’s purchasing process?	107
(5.11.7) Provide further details of your organization’s supplier engagement on environmental issues.	109
(5.11.9) Provide details of any environmental engagement activity with other stakeholders in the value chain.	109

C6. Environmental Performance - Consolidation Approach 112

(6.1) Provide details on your chosen consolidation approach for the calculation of environmental performance data.....	112
--	-----

C7. Environmental performance - Climate Change..... 113

(7.1) Is this your first year of reporting emissions data to CDP?	113
(7.1.1) Has your organization undergone any structural changes in the reporting year, or are any previous structural changes being accounted for in this disclosure of emissions data?.....	113
(7.1.2) Has your emissions accounting methodology, boundary, and/or reporting year definition changed in the reporting year?	113
(7.1.3) Have your organization’s base year emissions and past years’ emissions been recalculated as a result of any changes or errors reported in 7.1.1 and/or 7.1.2?....	114
(7.2) Select the name of the standard, protocol, or methodology you have used to collect activity data and calculate emissions.	114
(7.3) Describe your organization’s approach to reporting Scope 2 emissions.	115
(7.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1, Scope 2 or Scope 3 emissions that are within your selected reporting boundary which are not included in your disclosure?	115
(7.5) Provide your base year and base year emissions.	115
(7.6) What were your organization’s gross global Scope 1 emissions in metric tons CO2e?	122
(7.7) What were your organization’s gross global Scope 2 emissions in metric tons CO2e?	122
(7.8) Account for your organization’s gross global Scope 3 emissions, disclosing and explaining any exclusions.	122
(7.9) Indicate the verification/assurance status that applies to your reported emissions.	129
(7.9.1) Provide further details of the verification/assurance undertaken for your Scope 1 emissions, and attach the relevant statements.	130
(7.9.2) Provide further details of the verification/assurance undertaken for your Scope 2 emissions and attach the relevant statements.	131
(7.9.3) Provide further details of the verification/assurance undertaken for your Scope 3 emissions and attach the relevant statements.	132
(7.10) How do your gross global emissions (Scope 1 and 2 combined) for the reporting year compare to those of the previous reporting year?	134
(7.10.1) Identify the reasons for any change in your gross global emissions (Scope 1 and 2 combined), and for each of them specify how your emissions compare to the previous year.	134
(7.10.2) Are your emissions performance calculations in 7.10 and 7.10.1 based on a location-based Scope 2 emissions figure or a market-based Scope 2 emissions figure?	140
(7.12) Are carbon dioxide emissions from biogenic carbon relevant to your organization?	140

(7.15) Does your organization break down its Scope 1 emissions by greenhouse gas type?	140
(7.15.1) Break down your total gross global Scope 1 emissions by greenhouse gas type and provide the source of each used global warming potential (GWP).	141
(7.15.4) Break down your total gross global Scope 1 emissions from oil and gas value chain production activities by greenhouse gas type.....	142
(7.16) Break down your total gross global Scope 1 and 2 emissions by country/area.	146
(7.17) Indicate which gross global Scope 1 emissions breakdowns you are able to provide.	146
(7.17.1) Break down your total gross global Scope 1 emissions by business division.	147
(7.19) Break down your organization’s total gross global Scope 1 emissions by sector production activity in metric tons CO2e.....	147
(7.20) Indicate which gross global Scope 2 emissions breakdowns you are able to provide.	147
(7.20.1) Break down your total gross global Scope 2 emissions by business division.	147
(7.21) Break down your organization’s total gross global Scope 2 emissions by sector production activity in metric tons CO2e.....	148
(7.22) Break down your gross Scope 1 and Scope 2 emissions between your consolidated accounting group and other entities included in your response.	148
(7.23) Is your organization able to break down your emissions data for any of the subsidiaries included in your CDP response?.....	149
(7.23.1) Break down your gross Scope 1 and Scope 2 emissions by subsidiary.	149
(7.24) Report your methane emissions as percentages of natural gas and hydrocarbon production or throughput.	150
(7.29) What percentage of your total operational spend in the reporting year was on energy?	151
(7.30) Select which energy-related activities your organization has undertaken.	152
(7.30.1) Report your organization’s energy consumption totals (excluding feedstocks) in MWh.....	152
(7.30.6) Select the applications of your organization’s consumption of fuel.	154
(7.30.7) State how much fuel in MWh your organization has consumed (excluding feedstocks) by fuel type.	155
(7.30.9) Provide details on the electricity, heat, steam, and cooling your organization has generated and consumed in the reporting year.....	160
(7.30.16) Provide a breakdown by country/area of your electricity/heat/steam/cooling consumption in the reporting year.	162
(7.38) Disclose your net liquid and gas hydrocarbon production (total of subsidiaries and equity-accounted entities).	165
(7.38.1) Explain which listing requirements or other methodologies you use to report reserves data. If your organization cannot provide data due to legal restrictions on reporting reserves figures in certain countries/areas, please explain this.	166
(7.38.2) Disclose your estimated total net reserves and resource base (million boe), including the total associated with subsidiaries and equity-accounted entities.	166
(7.38.3) Provide an indicative percentage split for 2P, 3P reserves, and total resource base by hydrocarbon categories.	167
(7.38.4) Provide an indicative percentage split for production, 1P, 2P, 3P reserves, and total resource base by development types.....	168
(7.45) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO2e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations.	170

(7.48) Provide the intensity figures for Scope 1 emissions (metric tons CO2e) per unit of hydrocarbon category.	172
(7.52) Provide any additional climate-related metrics relevant to your business.	173
(7.53) Did you have an emissions target that was active in the reporting year?	173
(7.53.1) Provide details of your absolute emissions targets and progress made against those targets.	173
(7.54) Did you have any other climate-related targets that were active in the reporting year?	177
(7.54.2) Provide details of any other climate-related targets, including methane reduction targets.	178
(7.55) Did you have emissions reduction initiatives that were active within the reporting year? Note that this can include those in the planning and/or implementation phases.	180
(7.55.1) Identify the total number of initiatives at each stage of development, and for those in the implementation stages, the estimated CO2e savings.	180
(7.55.2) Provide details on the initiatives implemented in the reporting year in the table below.	181
(7.57) Describe your organization’s efforts to reduce methane emissions from your activities.	188
(7.61) Does your organization conduct leak detection and repair (LDAR) or use other methods to find and fix fugitive methane emissions from oil and gas production activities?	188
(7.61.1) Describe the protocol through which methane leak detection and repair or other leak detection methods, are conducted for oil and gas production activities, including predominant frequency of inspections, estimates of assets covered, and methodologies employed.	188
(7.62) If flaring is relevant to your oil and gas production activities, describe your organization’s efforts to reduce flaring, including any flaring reduction targets.	189
(7.74) Do you classify any of your existing goods and/or services as low-carbon products?	189
(7.79) Has your organization canceled any project-based carbon credits within the reporting year?	189

C9. Environmental performance - Water security..... 190

(9.1) Are there any exclusions from your disclosure of water-related data?	190
(9.1.1) Provide details on these exclusions.	190
(9.2) Across all your operations, what proportion of the following water aspects are regularly measured and monitored?	191
(9.2.2) What are the total volumes of water withdrawn, discharged, and consumed across all your operations, how do they compare to the previous reporting year, and how are they forecasted to change?	198
(9.2.3) In your oil & gas sector operations, what are the total volumes of water withdrawn, discharged, and consumed (by business division), how do they compare to the previous reporting year, and how are they forecasted to change?	201
(9.2.4) Indicate whether water is withdrawn from areas with water stress, provide the volume, how it compares with the previous reporting year, and how it is forecasted to change.	204
(9.2.7) Provide total water withdrawal data by source.	206
(9.2.8) Provide total water discharge data by destination.	210

(9.2.9) Within your direct operations, indicate the highest level(s) to which you treat your discharge.	212
(9.3) In your direct operations and upstream value chain, what is the number of facilities where you have identified substantive water-related dependencies, impacts, risks, and opportunities?	214
(9.3.1) For each facility referenced in 9.3, provide coordinates, water accounting data, and a comparison with the previous reporting year.	216
(9.3.2) For the facilities in your direct operations referenced in 9.3.1, what proportion of water accounting data has been third party verified?	218
(9.5) Provide a figure for your organization’s total water withdrawal efficiency.	220
(9.11) Do you calculate water intensity for your activities associated with the oil & gas sector?	221
(9.11.1) Provide water intensity information associated with your activities in the oil & gas sector.	221
(9.13) Do any of your products contain substances classified as hazardous by a regulatory authority?	222
(9.14) Do you classify any of your current products and/or services as low water impact?	223
(9.15) Do you have any water-related targets?	223
(9.15.3) Why do you not have water-related target(s) and what are your plans to develop these in the future?.....	224

C10. Environmental performance - Plastics 225

(10.1) Do you have plastics-related targets, and if so what type?	225
---	-----

C11. Environmental performance - Biodiversity 226

(11.2) What actions has your organization taken in the reporting year to progress your biodiversity-related commitments?	226
(11.3) Does your organization use biodiversity indicators to monitor performance across its activities?	226
(11.4) Does your organization have activities located in or near to areas important for biodiversity in the reporting year?	226

C13. Further information & sign off 230

(13.1) Indicate if any environmental information included in your CDP response (not already reported in 7.9.1/2/3, 8.9.1/2/3/4, and 9.3.2) is verified and/or assured by a third party?.....	230
(13.2) Use this field to provide any additional information or context that you feel is relevant to your organization's response. Please note that this field is optional and is not scored.	230
(13.3) Provide the following information for the person that has signed off (approved) your CDP response.	231
(13.4) Please indicate your consent for CDP to share contact details with the Pacific Institute to support content for its Water Action Hub website.	231

C1. Introduction

(1.1) In which language are you submitting your response?

Select from:

English

(1.2) Select the currency used for all financial information disclosed throughout your response.

Select from:

USD

(1.3) Provide an overview and introduction to your organization.

(1.3.2) Organization type

Select from:

Publicly traded organization

(1.3.3) Description of organization

Founded in 1971, DNO is Norway's oldest oil company and the first to list on the Oslo Stock Exchange in 1981. Initially a North Sea player, our focus over the past two decades shifted to the Middle East region, home to the world's most prolific oil resources. By tapping into its Norwegian heritage and leveraging our regional footprint, DNO has proven a nimble and successful operator, even in challenging environments. In 2004, DNO was the first international oil company to enter the Kurdistan Region of Iraq (KRI), at a time when the Kurdish region's oil industry was virtually non-existent. We are now the leading international operator in terms of production and reserves in the KRI. At our flagship Tawke oil field, we began production in 2007 – just two years after the start of exploration activities. The neighbouring Peshkabir field was brought on production in 2017. Our operations in the region have among the lowest finding and development costs anywhere in the world. Combined with low lifting costs, this gives us a significant competitive advantage when oil prices are weak and strong cash flow when oil prices are robust. DNO re-entered the North Sea in 2017, acquiring offshore exploration licenses in Norway and the UK. The company has since expanded to include several producing assets offshore Norway and the UK. In 2022, DNO completed a transaction agreement pursuant to which RAK Petroleum plc transferred its ownership of Mondoil Enterprises LLC to DNO. Following this transaction, DNO holds an indirect 33.33 percent interest in the privately-held Foxtrot International which has stakes in two offshore blocks in Côte d'Ivoire. Foxtrot is the largest oil and gas company in the country; it produces over 85% of natural gas of Côte d'Ivoire. Wherever we operate, we look to minimize risk and maximize success through smart exploration, and when a discovery is made, fast-track production. We are committed to safe, environmentally responsible and ethically sound operations. DNO's Health, Safety, Security and Environment (HSSE) Policy is clear concerning our commitments to

all aspects of HSSE including our environmental commitments: • Minimize undesirable effects on the environment and biodiversity resulting from our activities; • Promote the reduction of emissions and pollution from our operations; and • Contribute to the sustainable development of the regions where we operate. Business Units' (BU) internal assurance processes combined with oversight from the corporate management and the Board of Directors through its HSSE Committee ensure we meet our commitments.

[Fixed row]

(1.4) State the end date of the year for which you are reporting data. For emissions data, indicate whether you will be providing emissions data for past reporting years.

	End date of reporting year	Alignment of this reporting period with your financial reporting period	Indicate if you are providing emissions data for past reporting years
	12/31/2023	Select from: <input checked="" type="checkbox"/> Yes	Select from: <input checked="" type="checkbox"/> No

[Fixed row]

(1.4.1) What is your organization’s annual revenue for the reporting period?

667500000

(1.5) Provide details on your reporting boundary.

(1.5.1) Is your reporting boundary for your CDP disclosure the same as that used in your financial statements?

Select from:

No

(1.5.2) How does your reporting boundary differ to that used in your financial statement?

Our GHG and water reporting covers only our offices and operated oil and gas assets. These include: Iraq, Norway, United Arab Emirates and United Kingdom.

[Fixed row]

(1.6) Does your organization have an ISIN code or another unique identifier (e.g., Ticker, CUSIP, etc.)?

ISIN code - bond

(1.6.1) Does your organization use this unique identifier?

Select from:

Yes

(1.6.2) Provide your unique identifier

NO0011088593

ISIN code - equity

(1.6.1) Does your organization use this unique identifier?

Select from:

Yes

(1.6.2) Provide your unique identifier

NO0003921009

CUSIP number

(1.6.1) Does your organization use this unique identifier?

Select from:

No

Ticker symbol

(1.6.1) Does your organization use this unique identifier?

Select from:

Yes

(1.6.2) Provide your unique identifier

DNO (listed on Oslo Stock Exchange)

SEDOL code

(1.6.1) Does your organization use this unique identifier?

Select from:

No

LEI number

(1.6.1) Does your organization use this unique identifier?

Select from:

No

D-U-N-S number

(1.6.1) Does your organization use this unique identifier?

Select from:

No

Other unique identifier

(1.6.1) Does your organization use this unique identifier?

Select from:

No

[Add row]

(1.7) Select the countries/areas in which you operate.

Select all that apply

Iraq

Norway

United Arab Emirates

United Kingdom of Great Britain and Northern Ireland

(1.19) In which part of the oil and gas value chain does your organization operate?

Oil and gas value chain

Upstream

(1.24) Has your organization mapped its value chain?

(1.24.1) Value chain mapped

Select from:

No, but we plan to do so within the next two years

(1.24.4) Highest supplier tier known but not mapped

Select from:

Tier 1 suppliers

(1.24.8) Primary reason for not mapping your upstream value chain or any value chain stages

Select from:

Judged to be unimportant or not relevant

(1.24.9) Explain why your organization has not mapped its upstream value chain or any value chain stages

DNO is an international but relatively small oil and gas company with less than 0.1% of global supply. With respect to upstream value chain, our suppliers range from very large international multi-billion dollar companies to relatively small local companies with turnover of a few tens/hundred thousand dollars. In 2023, we had about 1,100 suppliers, detailed mapping of them with respect to climate change and water security is not practical. However, all of our suppliers are required to sign DNO's Business Partner Code of Conduct Declaration, which among other things, requires all suppliers to at a minimum, comply with DNO's environmental and safety requirements. We also have continuous dialogue with our relevant suppliers (on a risk-based priority) to assess and improve their performance, including with respect to the environment. We occasionally audit our suppliers to ensure compliance with relevant regulations and DNO's standards (including with respect to various angles of Environmental, Social and Governance, ESG) to ensure compliance. With respect to customer and downstream value chain, the lion's share of our impact with respect to climate change is category 11 of scope 3 GHG emissions (use of sold products). We believe DNO (with less than 0.1% of global supply) has very limited ability to influence the market (and notably scope 3 emissions). DNO supports the goals of the Paris Agreement to limit global warming to well below 2C and pursue efforts to limit it to 1.5C. We have been very focused on reducing our scope 1 emissions and water use in the near term where we have visibility and control.

[Fixed row]

(1.24.1) Have you mapped where in your direct operations or elsewhere in your value chain plastics are produced, commercialized, used, and/or disposed of?

(1.24.1.1) Plastics mapping

Select from:

No, and we do not plan to within the next two years

(1.24.1.5) Primary reason for not mapping plastics in your value chain

Select from:

Judged to be unimportant or not relevant

(1.24.1.6) Explain why your organization has not mapped plastics in your value chain

We do not believe plastic production, use, disposal/ recycling are significant in our value chain. We monitor latest regulatory developments and increase our scrutiny if needed.

[Fixed row]

C2. Identification, assessment, and management of dependencies, impacts, risks, and opportunities

(2.1) How does your organization define short-, medium-, and long-term time horizons in relation to the identification, assessment, and management of your environmental dependencies, impacts, risks, and opportunities?

Short-term

(2.1.1) From (years)

0

(2.1.3) To (years)

1

(2.1.4) How this time horizon is linked to strategic and/or financial planning

As is typical for the oil and gas industry, DNO owns its oil and gas licenses (also called concessions) together with other companies in un-incorporated joint ventures, where one of these companies is nominated as the operator. The operator must provide its joint venturers with a detailed work program and budget, for each subsequent year. This is then approved by the joint ventures and when relevant, the host government. Therefore, one year is the short-term time horizon for business planning purposes.

Medium-term

(2.1.1) From (years)

1

(2.1.3) To (years)

5

(2.1.4) How this time horizon is linked to strategic and/or financial planning

On an annual basis, DNO prepares a five-year plan to assess various pathways for development of the company. Therefore, period of five years represents the medium-term for business planning purposes.

Long-term

(2.1.1) From (years)

5

(2.1.2) Is your long-term time horizon open ended?

Select from:

No

(2.1.3) To (years)

30

(2.1.4) How this time horizon is linked to strategic and/or financial planning

Typically, oil and gas licenses last for around thirty years, hence this is the long-term horizon for DNO as an upstream oil and gas company.
[Fixed row]

(2.2) Does your organization have a process for identifying, assessing, and managing environmental dependencies and/or impacts?

	Process in place	Dependencies and/or impacts evaluated in this process
	Select from: <input checked="" type="checkbox"/> Yes	Select from: <input checked="" type="checkbox"/> Both dependencies and impacts

[Fixed row]

(2.2.1) Does your organization have a process for identifying, assessing, and managing environmental risks and/or opportunities?

	Process in place	Risks and/or opportunities evaluated in this process	Is this process informed by the dependencies and/or impacts process?
	Select from: <input checked="" type="checkbox"/> Yes	Select from: <input checked="" type="checkbox"/> Both risks and opportunities	Select from: <input checked="" type="checkbox"/> Yes

[Fixed row]

(2.2.2) Provide details of your organization's process for identifying, assessing, and managing environmental dependencies, impacts, risks, and/or opportunities.

Row 1

(2.2.2.1) Environmental issue

Select all that apply

- Climate change
- Water
- Biodiversity

(2.2.2.2) Indicate which of dependencies, impacts, risks, and opportunities are covered by the process for this environmental issue

Select all that apply

- Dependencies
- Impacts

- Risks
- Opportunities

(2.2.2.3) Value chain stages covered

Select all that apply

- Direct operations

(2.2.2.4) Coverage

Select from:

- Full

(2.2.2.7) Type of assessment

Select from:

- Qualitative and quantitative

(2.2.2.8) Frequency of assessment

Select from:

- More than once a year

(2.2.2.9) Time horizons covered

Select all that apply

- Short-term
- Medium-term
- Long-term

(2.2.2.10) Integration of risk management process

Select from:

- Integrated into multi-disciplinary organization-wide risk management process

(2.2.2.11) Location-specificity used

Select all that apply

- Not location specific

(2.2.2.12) Tools and methods used

Enterprise Risk Management

- Internal company methods

Other

- Materiality assessment
- Scenario analysis

(2.2.2.13) Risk types and criteria considered

Acute physical

- Drought
- Flood (coastal, fluvial, pluvial, ground water)
- Heavy precipitation (rain, hail, snow/ice)
- Landslide
- Pollution incident

Chronic physical

- Groundwater depletion
- Increased severity of extreme weather events
- Water stress

Policy

- Carbon pricing mechanisms
- Changes to national legislation
- Increased difficulty in obtaining operations permits

- Regulation of discharge quality/volumes

Reputation

- Impact on human health

Technology

- Transition to lower emissions technology and products

Liability

- Non-compliance with regulations

(2.2.2.14) Partners and stakeholders considered

Select all that apply

- NGOs
- Employees
- Investors
- Suppliers
- Regulators
- Local communities
- Other commodity users/producers at a local level

(2.2.2.15) Has this process changed since the previous reporting year?

Select from:

- No

(2.2.2.16) Further details of process

DNO has a well implemented process for identifying and assessing environmental (including climate, water and biodiversity) risks, opportunities (including impacts and dependencies) based on a Risk Assessment Matrix (RAM), which is included in our company-wide risk and opportunity assessment process. Time horizon considered are short term (less than one year), medium term (1-5 years) and long term (5-30 years). On a quarterly basis (i.e., four times a year), we carry out a bottom-up risk identification, assessment and review process, which covers relevant environmental-related items (including climate change, water security and biodiversity protection). Following identification and analysis, relevant mitigations are put in place. All risks and opportunities are assigned to competent owners who have the responsibility of following the closure of actions to control and/or reduce risk or realize the opportunity. The results of the process are reviewed by the corporate management. All resulting risks that are considered to have a substantive financial impact are reported to the board of directors' Audit Committee.

Substantive HSSE related risks, including climate change related issues are also reported to the board of directors' HSSE Committee. We also use sensitivity analysis to assess robustness of our portfolio under climate change related scenarios. We use International Energy Agency (IEA) scenarios of: Net Zero by 2050, Announced Pledges and Stated Policies, Results are published in our annual report. In 2023, we increased our focus and efforts to improve our internal policies and routines for assessments of risks, opportunities and dependencies related to environmental issues (and wider categories of Environmental, Social and Governance, ESG) as part of our efforts to comply with European Unions' evolving regulatory framework with respect to environmental and sustainability topics such as Taxonomy regulations and Corporate Sustainability Reporting Directive.

[Add row]

(2.2.7) Are the interconnections between environmental dependencies, impacts, risks and/or opportunities assessed?

(2.2.7.1) Interconnections between environmental dependencies, impacts, risks and/or opportunities assessed

Select from:

No

(2.2.7.3) Primary reason for not assessing interconnections between environmental dependencies, impacts, risks and/or opportunities

Select from:

Not an immediate strategic priority

(2.2.7.4) Explain why you do not assess the interconnections between environmental dependencies, impacts, risks and/or opportunities

DNO has a well implemented process for identifying and assessing environmental (including climate, water and biodiversity) risks, opportunities (including impacts and dependencies) based on a Risk Assessment Matrix (RAM), which is included in our company-wide risk and opportunity assessment process. However, we have not yet expanded our analysis to fully cover interdependencies and interconnection between environmental dependencies, impacts, risks and opportunities. Therefore, we have chosen "No" to answer this question. It is of note that in 2023, we increased our focus and efforts to improve our internal policies and routines for assessments of risks, opportunities and dependencies related to environmental issues (and wider categories of Environmental, Social and Governance, ESG) as part of our efforts to comply with European Unions' evolving regulatory framework with respect to environmental and sustainability topics such as Taxonomy regulations and Corporate Sustainability Reporting Directive. Therefore, we expect to cover these topics, when relevant to our business, in the next two years.

[Fixed row]

(2.3) Have you identified priority locations across your value chain?

(2.3.1) Identification of priority locations

Select from:

- No, but we plan to within the next two years

(2.3.7) Primary reason for not identifying priority locations

Select from:

- Not an immediate strategic priority

(2.3.8) Explain why you do not identify priority locations

DNO has operations in three areas: Kurdistan region of Iraq (onshore) and Norway and the UK (offshore). Our current assessment is that our operations in Kurdistan are not in proximity of areas with ecosystems whose wellbeing and resilience are challenged or concerning. Offshore operations in Norway and the UK are heavily regulated and DNO complies with all relevant regulations and best practices to avoid/ mitigate adverse effects on ecosystems. Our assessment is that such effects are not material to grand identification of priority locations. It is of note that all activities of DNO which are deemed to have adverse effects on the environment (e.g., ecosystems, water resources) are subject to thorough environmental Impact Assessments (EIA), which are reviewed and approved by relevant regulatory bodies, in addition to DNO's internal requirements which are based on relevant best international practices. We also expect the same care and due diligence from our suppliers. It is of note that in 2023, we increased our focus and efforts to improve our internal policies and routines for assessments of risks, opportunities and dependencies related to environmental issues (and wider categories of Environmental, Social and Governance, ESG) as part of our efforts to comply with European Unions' evolving regulatory framework with respect to environmental and sustainability topics such as Taxonomy regulations and Corporate Sustainability Reporting Directive. Therefore, we expect to improve our analysis and disclosures in the next two years.

[Fixed row]

(2.4) How does your organization define substantive effects on your organization?

Risks

(2.4.1) Type of definition

Select all that apply

- Qualitative
- Quantitative

(2.4.2) Indicator used to define substantive effect

Select from:

- Direct operating costs

(2.4.3) Change to indicator

Select from:

- Absolute increase

(2.4.5) Absolute increase/ decrease figure

1000000

(2.4.6) Metrics considered in definition

Select all that apply

- Frequency of effect occurring
- Time horizon over which the effect occurs
- Likelihood of effect occurring

(2.4.7) Application of definition

DNO defines financial impact in terms of both probability of occurrence (which takes into account frequency of occurrence and time horizons) and consequence should it occur. Financial impact assessment is also part of strategic impact assessment. DNO uses a five-by-five matrix for financial and strategic risk/ opportunity assessment, a common practice among oil and gas companies. The probability (likelihood of occurrence) dimension of the matrix has five options (Very Unlikely, Unlikely, Possible, Likely and Very Likely). The probability dimension is assessed based on frequency of past events in addition to expected future trends over different time scales. The consequence dimension of the matrix has five options as well (Minimal, Minor, Significant, Major and Catastrophic). Risks and opportunities which are deemed substantive are those that combine either Significant consequence with Very Likely probability of occurrence; Major consequence with Likely or Very Likely probability of occurrence; or Catastrophic consequences with Unlikely, Possible, Likely or Very Likely probability of occurrence. A substantive risk/ opportunity is thus either: - one which is Very Likely to occur which has the potential to create damage to/ value for operations leading to losses/gains between USD 1 million (minimum threshold to have a Significant consequence) and USD 10 million; - one which is Likely to occur which has the potential to create damage to/ value for operations leading to losses/gains between USD 10 million (minimum threshold to have a Major consequence) and USD 100 million; or - one which, although Unlikely to occur, has the potential to create damage to/ value for operations leading to losses/gains of more than USD 100 million (minimum threshold to have a Catastrophic consequence). Any risk or opportunity that does not meet the above criteria (e.g., leading to losses/ gains below USD 1 million and thus having a Minimal or Minor consequence) is considered non-substantive. Time horizon for this exercise is short (less than one year), medium term (one to five years) and long term (five plus years).

Any risk or opportunity that does not meet the above criteria (e.g., leading to losses/ gains below USD 1 million and thus having a Minimal or Minor consequence) is considered non-substantive.

[Add row]

(2.5) Does your organization identify and classify potential water pollutants associated with its activities that could have a detrimental impact on water ecosystems or human health?

(2.5.1) Identification and classification of potential water pollutants

Select from:

Yes, we identify and classify our potential water pollutants

(2.5.2) How potential water pollutants are identified and classified

DNO has operations in Kurdistan region of Iraq, Norway and the UK. In addition to being subject to and complying with numerous national and regional regulatory frameworks, DNO has put in place multiple internal policies processes and procedures to ensure minimal adverse effects on the environment including water ecosystems and human health. Our Corporate Water Management and Accounting Policy states that “all activities impacting water resources should be compliant with applicable environmental regulations (e.g., discharge permits) and follow industry best practices (e.g., IPIECA and IOGP guidelines). Our Corporate Health Safety Security and Environmental (HSSE) Policy Statement requires DNO’s operations to minimize undesirable effects on the environment (including water resources) and biodiversity resulting from our activities; promote reduction of emissions and pollution from our operations; and minimize fresh water used in operation. All of DNO’s major activities are subject to Environmental Impact Assessments (EIA), part of which is identifying and managing risk of water pollutants, in compliance with relevant regulations and best industry practices. There are strict regulations related to any discharge to sea in Norway, both for crude oil and chemicals. According to these, oil content in any water discharged to sea shall be “As Low As Possible” and according to “Best Available Technology (BAT)” and “Best Environmental Practice (BEP)”.

[Fixed row]

(2.5.1) Describe how your organization minimizes the adverse impacts of potential water pollutants on water ecosystems or human health associated with your activities.

Row 1

(2.5.1.1) Water pollutant category

Select from:

- Oil

(2.5.1.2) Description of water pollutant and potential impacts

DNO as an upstream oil and gas company uses a large set of chemicals. Crude oil and natural gas are the primary products. Some of these chemicals may have the potential to have adverse impacts on the environment (e.g., water and soil and human health). Listing all such chemicals is not realistic for this disclose. However as explained above DNO manages and mitigates these risks as part of its companywide risk management system which among other things considers applicable environmental regulations and relevant industry best practices. As an example of a relevant chemical which can be a water pollutant is crude oil. Since it is often lighter than water (lower density), in case of contaminating freshwater resources (e.g., sea water) it can float on the surface of water and cause damage to inhabitants (such as birds) as a toxic chemical. In 2023, DNO drilled one well (Norma) in Norway. Discharges to sea included cuttings with Water-Based-Mud Residue and oily drainage water, all being within the Norwegian Environment Authority (NEA) permit requirements. Drainage water was cleaned and sampled before discharge to sea, and the average oil content was 3.7-5 mg per liter. This is well below legal requirement of 30. All chemicals were evaluated based on HOCNF information and discharges reported according to color classification where Black has the highest risk of environmental impact, and Green the lowest and pose little or no concern of environmental impact.

(2.5.1.3) Value chain stage

Select all that apply

- Direct operations

(2.5.1.4) Actions and procedures to minimize adverse impacts

Select all that apply

- Upgrading of process equipment/methods
- Beyond compliance with regulatory requirements
- Reduction or phase out of hazardous substances
- Implementation of integrated solid waste management systems

- ☑ Requirement for suppliers to comply with regulatory requirements
- ☑ Industrial and chemical accidents prevention, preparedness, and response
- ☑ Discharge treatment using sector-specific processes to ensure compliance with regulatory requirements
- ☑ Assessment of critical infrastructure and storage condition (leakages, spillages, pipe erosion etc.) and their resilience

(2.5.1.5) Please explain

DNO has only upstream oil and gas activities, which are heavily regulated by environmental authorities and applicable standards. Each Business Unit (BU) in DNO has a dedicated environment team which is accountable for identifying and classifying potential water pollutants as well as putting preventive corrective measures in place. Relevant risks are elevated to the BU's Manager (on a quarterly basis) and then to the company's CEO (or what we refer to in DNO terminology as the Managing Director or MD). Relevant material risks and mitigation measures are also reported to the Board of Directors. Specifically in Norway, DNO has included Environmental Management and Chemical Management into its Business Management System (BMS). Also, DNO as a member of the Offshore Norge (the association for oil and gas producer in Norway) has adopted Offshore Norway guidelines into its BMS system. These guidelines address how to be compliant with the Norwegian regulations, processes and procedures. Specifically in 2023, and as part of planning the Norma exploration well, DNO performed a comprehensive environmental risk assessment. This study was designed to address potential impacts of a large spill to seabed habitats, fish species, seabirds as well as shoreline. Also during the operations, use and discharge of all fluids (drilling mud, cement and completion fluids) were optimised to minimize use and discharge to sea.

(3.1.1) Provide details of the environmental risks identified which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future.

Climate change

(3.1.1.1) Risk identifier

Select from:

- Risk1

(3.1.1.3) Risk types and primary environmental risk driver

Policy

- Carbon pricing mechanisms

(3.1.1.4) Value chain stage where the risk occurs

Select from:

- Direct operations

(3.1.1.6) Country/area where the risk occurs

Select all that apply

- Iraq
- Norway
- United Kingdom of Great Britain and Northern Ireland

(3.1.1.9) Organization-specific description of risk

DNO has operations in three countries and regions: Kurdistan region of Iraq, Norway and the UK. Neither the Kurdistan region nor Iraq has introduced a carbon tax yet and they are not part of any cap & trade systems either. However, both Norway and the UK have GHG pricing schemes. In Norway, DNO's emissions are subject to a national CO2 tax as well as the European Union's (EU) Emissions Trading System (EU ETS, a cap & trade system). In Norway, we are also subject to a fee for NOx emissions. The UK set up the UK Emissions Trading System (UK ETS) in 2021 following its departure from the EU and EU's ETS. For the UK and Norway, there is little we can do other than reducing our emissions or purchasing quotas to comply. For DNO, the risk with the potential to have substantive financial impact on our business is that Iraq or the Kurdistan region introduces some form of carbon pricing or our product (crude oil) which is exported from Kurdistan will become subject to carbon border adjustment abroad. With increasing international attention to climate change and increasing carbon pricing regulations, it is possible that Iraq/Kurdistan impose some sort of CO2 pricing. For example, the Iraqi president ratified the Paris Agreement in 2021. While remains uncertain, Iraq is likely to introduce more environmental regulations and restrictions in order to comply with its Paris Agreement commitments and this could include carbon pricing.

(3.1.1.11) Primary financial effect of the risk

Select from:

- Increased compliance costs

(3.1.1.12) Time horizon over which the risk is anticipated to have a substantive effect on the organization

Select all that apply

- Long-term

(3.1.1.13) Likelihood of the risk having an effect within the anticipated time horizon

Select from:

- More likely than not

(3.1.1.14) Magnitude

Select from:

Medium-low

(3.1.1.16) Anticipated effect of the risk on the financial position, financial performance and cash flows of the organization in the selected future time horizons

In 2023, there was no regulatory carbon pricing mechanism in place in Kurdistan (or Iraq) and we do not have any reliable indications from the host government that this may change in the foreseeable future. However, considering the general trends of global regulations on GHG emissions, it is not unlikely that a regulatory CO2 price comes into effect in medium/ long future. Providing a reliable estimate is not possible in the absence of information from the regulatory authorities on possible upcoming carbon pricing mechanisms. But we can provide a range (next column) which show the financial impact is unlikely to be material (less than USD 22 million a year, compared to our estimated annual revenues of over USD 1.5 billion (assuming USD 60/bbl oil price and production of 80,000 barrels of oil per day) from our Kurdistan (Iraq) operations. However, as our oil production licenses reach end of their terms and production and thus revenues decline (in 2030's), emissions costs can become important/ material to the business.

(3.1.1.17) Are you able to quantify the financial effect of the risk?

Select from:

Yes

(3.1.1.23) Anticipated financial effect figure in the long-term – minimum (currency)

4400000

(3.1.1.24) Anticipated financial effect figure in the long-term – maximum (currency)

21900000

(3.1.1.25) Explanation of financial effect figure

*In 2023, there was no regulatory carbon pricing mechanism in place in Kurdistan (or Iraq) and we do not have any indications from the host government that this may change in future. However, considering the general trends of global regulations on GHG emissions, it is not unlikely that a regulatory CO2 price comes into effect in medium/ long future. Providing a reliable estimate is not possible in the absence of information/ details from the regulatory authorities on possible upcoming carbon pricing mechanisms. But we can provide a range. Calculations: Upper range: USD 50/tonne CO2e in carbon tax/ fees * 15 kgCO2e/barrel of oil produced as the GHG intensity of DNO*80,000 barrels of oil production per day as DNO's production *365 days in one year USD 21.9 million per year Lower range: USD 15/tonne CO2e in carbon tax* 10 kgCO2e/barrel of oil produced as the GHG intensity of DNO*80,000 barrels of oil produced per day as DNO's daily oil production rate *365 days in one year USD 4.4 million per year Assumptions: We have assumed a CO2 intensity range of 10-15 kgCO2e per barrel of oil produced in the long term for DNO's assets in Kurdistan region of Iraq. We have assumed a production rate of 80,000 barrels per day for this exercise. We have assumed a carbon tax range of 50-15 USD/tCO2e.*

(3.1.1.26) Primary response to risk

Infrastructure, technology and spending

- Increase environment-related capital expenditure

(3.1.1.27) Cost of response to risk

16200000

(3.1.1.28) Explanation of cost calculation

Assuming solar photovoltaic (PV) cost of USD 1,350 per kilo watt (kW), 18% capacity factor and 20% cost of capital, the levelized cost of electricity is: $1,350 \text{ USD/kW} \times 20\% \text{ (cost of capital)} / 18\% \text{ (capacity factor)} / (365 \times 24 \text{ hours in one year}) \times (1,000 \text{ to convert from USD/kWh to USD/MWh}) = 171 \text{ USD/MWh}$ Cost of diesel-based electricity: $1 \text{ tCO}_2/\text{MWh}$ (GHG intensity of diesel-based electricity) \times USD 30/ tCO₂e (carbon tax) 30 USD/MWh Cost of diesel-based electricity is USD 166 per MWh: $\text{USD } 0.50/\text{liter}$ (cost of diesel) / 30% (efficiency of generator) / 36 MJ/liter (heating value of diesel) \times 3600 (for unit conversion from MJ to MWh) 166 USD per/ MWh. Total cost of diesel-based electricity would be 166 (fuel cost) + 30 (GHG fee) = 196 USD/MWh compared to the cost of solar PV of 171 USD/MWh. We assume DNO will build a 12 MW solar plant with total cost of: $\text{USD } 1,350/\text{kW}$ (unit cost of solar PV) \times 12,000 kW (size of solar plant) = USD 16.2 million

(3.1.1.29) Description of response

Mitigation strategy: DNO could invest in solar PV to reduce GHG emissions and operating costs. Although costs are uncertain, we can provide a range: assuming solar PV cost of USD 1,350/kW (source: USA's EIA) with 18% capacity factor (i.e., percentage of year when the Sun is shining) and 20% cost of capital lead to a levelized cost of electricity (unit cost of electricity) of 171 USD per MWh of solar electricity: $1,350 \text{ (capital cost per kW)} \times 20\% \text{ (cost of capital)} / 18\% \text{ (capacity factor)} / (365 \times 24 \text{ hours in year}) \times (1,000 \text{ to convert USD/kWh to USD/MWh}) = 171 \text{ USD/MWh}$. As the business-as-usual scenario (no PV), we consider diesel. With GHG intensity of 1 tonne CO₂/MWh for diesel-based electricity (source: USA's EIA), and CO₂ price of USD 30/tonne, GHG tax on diesel-based electricity is 30 USD per MWh. $1 \text{ tCO}_2/\text{MWh}$ (GHG intensity of diesel-based electricity) \times USD 30/ tCO₂ (carbon tax) 30 USD/MWh. Fuel cost is estimated at USD 166 per MWh of diesel-based electricity: using diesel price of USD 0.50/liter, efficiency of 30% and heating value of 36 MJ/liter for diesel. $\text{USD } 0.50/\text{liter}$ (cost of diesel) / 30% (efficiency of generator) / 36 MJ/liter (heating value of diesel) \times 3600 (convert MJ to MWh) 166 USD per MWh of diesel-based electricity. Total cost of diesel-based electricity would be 166 (fuel cost) + 30 (GHG fee) = 196 USD/MWh compared to the cost of solar PV of 171 USD/MWh. We assume DNO will build a 12 MW solar plant to supply electricity in combination with the existing diesel-fueled generators. Investment required for 12 MW solar PV plant to partially mitigate the risk is: $\text{USD } 1,350/\text{kW}$ (unit cost of PV) \times 12,000 kW (size of PV plant) = USD 16.2 million. Building solar PV contributes towards UN's Sustainable Development Goals (SDG) 7 and 13. To ensure we remain competitive and fit in national GHG targets, we have set a GHG intensity target of being well below industry average. We are also increasingly focused on flare reduction and reduction of methane emissions.

(3.1.1.9) Organization-specific description of risk

In Kurdistan region of Iraq, recent winters and springs have been wetter and more extreme than the historical average. Iraq is among the most vulnerable countries in the Middle East to climate change and impacts of changing weather and precipitation patterns have already made themselves felt in recent years, with a higher frequency and intensity of extreme weather events. More heavy rainfalls during winter and spring have resulted in more transported river debris and much faster flow of the river adjacent to DNO's oil and gas pipelines (most recently observed during severe torrential flooding in March 2024). Severe and rapid erosion of the riverbanks and/or riverbed have been experienced in recent winters/springs during storms and it is expected that this will continue. In the worst-case scenario, such rapid erosion and storm debris could lead to damage to one or both pipelines, potentially leading to pollution and the need to halt production and financial losses.

(3.1.1.16) Anticipated effect of the risk on the financial position, financial performance and cash flows of the organization in the selected future time horizons

*The potential financial impact figure is calculated from having to shut down operations for up to a week if pipelines are damaged. A halt in production from the Tawke field in Kurdistan, production from which averaged about 27,000 barrels per day in 2023, would result in a loss in production of about 190,000 barrels in one week. At realized oil prices of USD 60 per barrel, the lost production is valued at approximately 190,000*60 USD 11.4 million. If the damage to the pipelines also resulted in soil and/or water pollution, the financial (and reputational) impact would be much higher. However, this figure is extremely difficult to estimate as it depends on many factors including the exact location of the damage, the extent of the damage, environmental conditions (e.g., water level and current) and speed of response. Our assessment is that the maximum cost of environmental remediation due to a pipeline rupture will be around USD 15 million. Therefore, the total is 11.415 USD 26.4 million. However, we do not anticipate this number to be significant compared to total revenues from our Kurdistan operations, which is estimated at over USD 1.5 billion per year (assuming 80,000 barrels of day production and oil price of USD 60/bbl in the long run).*

(3.1.1.26) Primary response to risk

Policies and plans

Develop flood emergency plans

(3.1.1.27) Cost of response to risk

3000000

(3.1.1.28) Explanation of cost calculation

The cost estimate is based on conceptual engineering studies, experience from similar projects and DNO's internal cost database. DNO has also received quotes from third-parties for engineering and construction of an overpass for the pipelines. These quotes in addition to DNO's inhouse cost estimates are the basis for the USD 3 million estimate provided here. This is split into USD 1.4 million for the overpass bridge and USD 1.6 million for engineering, procurement, management and implementation of the riverbank and riverbed reinforcement.

(3.1.1.29) Description of response

To mitigate the risk of having to halt production in Kurdistan due to more extreme weather conditions, DNO has put in place a major upgrade project to the physical storm protection measures for its pipelines (reinforcement of riverbank and riverbed at river crossing of our pipelines in Kurdistan) since 2020. These protection and corrective measures and field activities are reviewed and upgraded annually or earlier as needs arise. The cost of responding to the risk of more extreme weather is an estimate for the storm protection measures (both along the riverbanks and at the river crossing of pipelines) and any possible free spanning of pipelines at the bottom of the river due to faster-than-normal river flows. Example of mitigation measures are stabilizing the riverbed and reinforcing pipelines' supports in the riverbed as well as protecting riverbanks from erosion. Also, DNO has assessed the possibility of building an overpass in order not to pass the pipelines through the river. The cost estimate is based on conceptual engineering studies, experience from similar projects and DNO's internal cost database. DNO has also worked with third-parties to assess engineering and construction requirements of an overpass for the pipelines. These cost estimates in addition to DNO's inhouse cost estimates are the basis for the USD 3 million estimate provided here. This is split into USD 1.4 million for the overpass bridge and USD 1.6 million for engineering, procurement, management and implementation of the riverbank and riverbed reinforcement.

DNO has operations in both Norway and the UK where GHG emissions from certain activities can fall under their respective cap and trade systems: European Union (EU) ETS and UK ETS. In addition, the Norway activities are subject to Norway's CO2 tax. In 2023, DNO had had one operated activity (related to the Trym license in Norway) which was subject to EU's ETS. The emissions falling under EU ETS and related to this operation were 155 tCO2e (much less than 1% of our total scope 1 emissions). We purchased 155 quotas at average price of about 61.5 euros. Therefore, total costs were about 9,530 euros or USD 10,000. These emissions (155 tCO2e) are very insignificant to our total 2023 scope 1 emissions (247,191 tCO2e), therefore the percentage is stated at zero (0.06%). Please also note that DNO is a non-operator participant (owner) in several other licenses in Norway and the UK in which emissions are regulated under either the UK ETS or EU ETS (and/or Norway's carbon tax). Such emissions are not reported in this CDP disclosure because we use the "Operational Control" approach for reporting of our emissions in this questionnaire. Although we do not report our non-operated emissions via CDP, we can quantify total fees which DNO paid for its equity share of GHG emissions in 2023: a total of about USD 14.5 million (NOK 152 million) in CO2 quotas (ETS) and Norwegian CO2 taxes. On scope 2 emissions, one should note that we purchase electricity for our offices in Norway and the UK from the national grids. Suppliers of electricity may or may not be subject to Norway CO2 tax, EU ETS, or UK ETS but we do not have sufficient visibility to quantify them and in any event, they are insignificant compared with our scope 1 emissions, therefore we have reported 0 for scope 2 emissions subject to carbon pricing/ ETS.

(3.5.3.5) Comment

DNO's activities, as an upstream oil and gas company, in Norway may be subject to Norway's CO2 tax. In 2023 however, DNO had had no operated activity which was subject to Norway's national carbon tax. One should note that DNO is a non-operator participant (owner) in several other licenses in Norway, emissions of which are regulated under Norway's carbon tax. Such emissions are not reported in this CDP disclosure because we use "Operational Control" approach for reporting of our emissions in this questionnaire. On scope 2 emissions, one should note that we purchase electricity for our offices in Norway from the national grids. Suppliers of electricity may or may not be subject to Norway CO2 tax but we do not have visibility to quantify them (therefore we have reported 0 for scope 2 emissions subject to carbon pricing).

[Fixed row]

(3.5.4) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by?

DNO applies the same compliance strategy to these systems as all other laws and regulations as described in the Company's Compliance Charter: DNO manages compliance risk through three lines of defence: business management, compliance function and internal audit. Business management is the first line of defence. Operational management has ownership, responsibility and accountability for assessing, controlling and mitigating compliance risks and develops and implements mitigation activities, including monitoring and reporting, for managing compliance risks in business activities. As the second line of defence, the compliance function partners with the legal, risk management and, with respect to climate related issues, the Health, Safety, Security and Environment (HSSE) functions. They identify relevant compliance risks related to laws, regulations and standards. They translate the laws into compliance obligations and assist management to identify their compliance risks. They support the Company's management in identifying mitigating activities to mitigate the overall compliance risk based on the executive management's risk appetite, monitor local level management's control of compliance risks and advise management on compliance matters. Internal Audit provides management with a third line of defence through independent, objective assurance on the overall effectiveness of the design and operation of internal controls. Annual internal audit plans are established in consultation with the Board's Audit Committee and findings are reported to the executive management of the Company, and when relevant to the Board of Director's Audit and HSSE committees. A case study of our strategy of complying with systems that we anticipate to be regulated by is management of the risk of increased emissions intensity due to operational limitations. While GHG intensity of DNO's operated facilities (currently below 15 kgCO₂e/boe) is far below the global average of the upstream oil and gas sector, DNO is working on development of a frontier field in Kurdistan which during its initial phase can involve routine flaring of associated gas (due to lack of infrastructure, sales of the associated gas or sales of potential electricity generated from the gas is not possible). This can increase GHG intensity of DNO's operations with financial and reputational risks as well as regulatory risks (if a carbon price or a cap & trade system is introduced in Kurdistan for instance). In response, DNO maintains a forecast for its total (absolute) GHG emissions as well as its GHG emissions intensity to better inform its decision making and mitigation processes. Also, as a mitigation strategy purchase of international offsets have been extensively evaluated. In Norway, DNO is also working with its joint venture partners on reducing emissions. As a case in point, we have been in close discussions with our joint venture partners in one of our GHG intensive assets and the subject matter experts from the industry (including one leading technology company in Norway) to potentially install floating wind turbines to replace onsite gas turbines used for powering the offshore platform of this oil and gas production license. Due to its large capital expenditure and technology, financial and regulatory risks, a final decision has not been made but technical work has been ongoing for the last three years. The timescale for our strategy and implementation of it is short (less than one year), medium (one to five years) as well as long-term (beyond five years); however, the more relevant time scale is 0-5 years.

(3.6) Have you identified any environmental opportunities which have had a substantive effect on your organization in the reporting year, or are anticipated to have a substantive effect on your organization in the future?

Climate change

(3.6.1) Environmental opportunities identified

Select from:

Yes, we have identified opportunities, and some/all are being realized

Water

(3.6.1) Environmental opportunities identified

Select from:

No

(3.6.2) Primary reason why your organization does not consider itself to have environmental opportunities

Select from:

Opportunities exist, but none anticipated to have a substantive effect on organization

(3.6.3) Please explain

We have not identified any water-related opportunities which can have a substantial direct or indirect effect on our company within relevant planning horizons for DNO which is short term (less than one year), medium term (one to five years) and long term (five plus years). Risk and opportunity assessment is an ongoing process in DNO which is done quarterly both the business unit level (Kurdistan region of Iraq and North Sea) as well as corporate (enterprise level). Relevant risk and opportunities are elevated and presented to the senior management as well as company's board of directors. We have identified water-related opportunities but the financial impacts are assessed not to be sufficient to make a substantial direct or indirect impact on DNO. A prime example is use of produced water from oil production wells in Kurdistan (currently all of which is being injected back into the underground reservoir) to replace freshwater use for drilling operations. We have been designing the treatment and recycling process to make the produced water suitable for drilling operations (e.g., reducing potentially toxic and corrosive elements such as H₂S) and performed pilot tests. This project would have been important because it can reduce freshwater use (thus lowering operating cost) and preserve natural resources (freshwater). However, following a full evaluation, the project was assessed not to be financially viable. We will continue to look for and materialize water-related opportunities, especially in water stressed areas such as Kurdistan.

Iraq

(3.6.1.8) Organization specific description

DNO pioneers GHG reduction, both by expenditure and results, in Kurdistan region of Iraq (DNO's core area of operations in terms of production and emissions in 2023). DNO operates the first and only associated gas capture and injection project in Kurdistan. Development of the Peshkibir field in the Tawke license in Kurdistan commenced in 2017. The oil produced had higher than expected associated gas content, leading to higher than anticipated production of associated gas (co-produced with oil). This provided DNO with the opportunity to reinject the gas from Peshkibir field into the nearby Tawke oil field for reservoir pressure management and thus improved oil recovery. The climate related opportunity driver for the project is the significant reduction in flaring of associated gas and using it to replace more GHG intensive fuels used in operations (diesel and naphtha). The financial impact is that injecting gas into Tawke is expected to increase the oil reserves recoverable from the field. In 2020, DNO commissioned the first phase of its associated gas injection project (cost of USD 110 million). Phase 2 of the gas injection project was commissioned in 2023, which enabled capturing and reinject any associated gas produced at the Tawke field back into the Tawke field. The cost of the second phase was USD 25 million. A total of 22 billion cubic feet (bcf) of otherwise-flared gas has been captured and injected by end 2023, delivering a significant GHG savings of 1.4 million tCO₂

(3.6.1.9) Primary financial effect of the opportunity

Select from:

High

(3.6.1.14) Anticipated effect of the opportunity on the financial position, financial performance and cash flows of the organization in the selected future time horizons

*The financial impact comes from the value of added reserves and production from the Tawke field because of improved recovery factor (improved oil recovery) from injecting Peshkabir field's gas into Tawke field. It is calculated by multiplying the forecast incremental production due to gas injection by the forecast oil price. The share of the incremental revenue that goes to the government through the mechanism of the production sharing contract is then deducted to give the financial benefit to DNO and its partner. The actual production impact is uncertain due to the heterogeneity of the Tawke field reservoir. The potential financial impact figure is derived from the incremental production that reservoir modelling indicates to be most likely. The reserves associated with this incremental production are included in the DNO's proven and probable (2P) reserves. The 2P reserves associated with the gas injection project are 23.3 million barrels of oil. Of this 18.5 million barrels goes to the government through the production sharing contract that is in place, leaving 4.8 million barrels for DNO and its partner over the life of the license (until 2036). At an assumed average realized oil price of USD 50 per barrel, this gives an increase in revenue of USD 240 million to DNO and its partner (4.8 million barrels of oil *50 dollars per barrel of oil, equal to USD 240 million).*

At an assumed average realized oil price of USD 50 per barrel, this gives an increase in revenue of USD 240 million to DNO and its partner (4.8 million barrels of oil *50 dollars per barrel of oil, equal to USD 240 million).*

(3.6.1.24) Cost to realize opportunity

135000000

(3.6.1.25) Explanation of cost calculation

In 2020, DNO commissioned the first phase of its associated gas injection project (cost of USD 110 million). Phase 2 of the gas injection project was commissioned in early 2023, which enabled capturing and reinject any associated gas produced at the Tawke field back into the Tawke field. The cost of the second phase was USD 25 million. Therefore, total cost of USD 135 million.

(3.6.1.26) Strategy to realize opportunity

To collect produced gas at the Peshkabir field and inject it in the Tawke field, it required construction of a gas treatment plant at the Peshkabir field, gas compression and pipeline systems to transport the treated gas from the Peshkabir field to the Tawke field and retrofitting existing/ drilling new wells for gas injection. Phase 1 of the project was commissioned in 2020 at a total cost of about USD 110 million. The main components of this project were building a gas processing facility in the Peshkabir field, a series of compressors and gas pipelines to deliver the processed gas from the Peshkabir field to the Tawke field for injection in five gas injection wells. Phase 2 of the gas injection project which aims to capture and reinject into the Tawke field any associated gas produced at the Tawke field was commissioned in 2023, for a total cost of about USD 25 million. The main component of the second phase was a new gas processing plant (and associated compressors and pipelines) to enable injection of any produced gas at the Tawke field back into the Tawke field. As both phases are now complete, the cost to realize the opportunity (USD 11025 million) is the actual cost that DNO has spent realising the project, rounded off to the nearest USD 10 million.

(3.6.1.8) Organization specific description

Over the past several years and notably since 2020, DNO has experienced an increasing number of environmental/ sustainability related enquiries from existing and prospective investors (shareholders and bond holders), banks, financial institutions, and insurance underwriters, collectively referred to here as the Financial Community. DNO recognises that to maintain access to quality financial services and attract investors, it needs to be transparent on its environmental (including climate change, water security and biodiversity) related performance (as well as its performance in other areas of Corporate Social Responsibility CSR, and Environment, Social and Governance ESG) and set responsible targets and key performance indicators (KPI) for its business. To address this, DNO has submitted a CDP report every year since 2008; it has had third-party verification of its emissions data since 2015; it has a Health, Safety, Security and Environment (HSSE) performance section in its Annual Report which includes emissions reporting; and adopted a comprehensive template for its ESG report (“DNO’s Corporate Social Responsibility (CSR) Report”). DNO is currently working on enhancing its environmental performance and internal controls as DNO will be subject to EU’s Corporate Sustainability Reporting Directive from 2024, in addition to EU’s Taxonomy Directive which has applied to DNO since 2023.

(3.6.1.9) Primary financial effect of the opportunity

(3.6.1.14) Anticipated effect of the opportunity on the financial position, financial performance and cash flows of the organization in the selected future time horizons

*The impact of our climate related performance and reporting on share price and cost of capital/ debt is not possible to be quantified with any certainty as they are influenced by many other factors and therefore, we cannot provide reliable number. However, to illustrate the potential, one can assume that a positive perception of DNO's environmental stance amongst investors could reduce the cost of bond debt through a 0.25 percent lower interest rate. As DNO currently has two bond loans, together worth USD 750 million, this would represent a saving of USD 1.875 million per year. Considering a maturity period of five years for bond, the savings over the bond life would be USD 6.6 million. $0.25\% * USD 750 million * 5 years = USD 9.375 million$*

9375000

(3.6.1.23) Explanation of financial effect figures

*For this estimation, we have assumed that a positive perception of DNO's environmental stance amongst investors could reduce the cost of bond debt through a 0.25 percent lower interest rate. As DNO currently has two bond loans, together worth USD 750 million, this would represent a saving of USD 1.875 million per year. Considering a maturity period of five years for bond, the savings over the bond life would be USD 6.6 million. $0.25\% * USD 750 million * 5 years = USD 9.375 million$*

(3.6.1.24) Cost to realize opportunity

22000

(3.6.1.25) Explanation of cost calculation

Our strategy on the disclosure and reporting side is to maintain CDP reporting, external verification of emissions, improving our GHG quantification standards and procedures, reporting of emissions in Annual Report and publishing an extensive ESG report on an annual basis with details on our environmental performance and results. To achieve this, in addition to internal resources such as significant management time (cost of which is not included here), we occasionally utilize external consultants. The cost stated here is the sum of costs for our third-party verification of year 2023 GHG numbers (USD 12k) and external costs for preparing our 2023 CDP disclosures (USD 10k). Note that this is on top of significant time devoted to these issues by the mid-level and senior management of the company.

(3.6.1.26) Strategy to realize opportunity

*To realize this opportunity, DNO has submitted a CDP report every year since 2008; it has had third-party verification of its emissions data since 2015; it has a Health, Safety, Security and Environment (HSSE) performance section in its Annual Report which includes emissions reporting; and adopted a comprehensive template for its ESG report ("DNO's Corporate Social Responsibility (CSR) Report"). DNO is currently working on enhancing its environmental performance and internal controls as DNO will be subject to EU's Corporate Sustainability Reporting Directive from 2024, in addition to EU's Taxonomy Directive which has applied to DNO since 2023.

(3.6.2) Provide the amount and proportion of your financial metrics in the reporting year that are aligned with the substantive effects of environmental opportunities.

Climate change

(3.6.2.1) Financial metric

Select from:

CAPEX

(3.6.2.2) Amount of financial metric aligned with opportunities for this environmental issue (unit currency as selected in 1.2)

18750000

(3.6.2.3) % of total financial metric aligned with opportunities for this environmental issue

Select from:

11-20%

(3.6.2.4) Explanation of financial figures

The USD 18.75 million figure relates to DNO's share (75%) of the cost of the second phase of associated gas injection at the Tawke license in Kurdistan region of Iraq, which was commissioned in early 2023 (Opportunity 1 explained above). DNO's total capital cost expenditure in 2023 was USD 164 million. Therefore, the ratio is USD 18.75/164 million 11.4%

(4.1.2.4) Frequency with which this environmental issue is a scheduled agenda item

Select from:

- Scheduled agenda item in every board meeting (standing agenda item)

(4.1.2.5) Governance mechanisms into which this environmental issue is integrated

Select all that apply

- Reviewing and guiding annual budgets
- Overseeing and guiding scenario analysis
- Overseeing the setting of corporate targets
- Monitoring progress towards corporate targets
- Approving corporate policies and/or commitments
- Overseeing and guiding acquisitions, mergers, and divestitures
- Monitoring compliance with corporate policies and/or commitments
- Overseeing and guiding the development of a climate transition plan
- Reviewing and guiding the assessment process for dependencies, impacts, risks, and opportunities
- Approving and/or overseeing employee incentives
- Overseeing and guiding major capital expenditures
- Monitoring the implementation of the business strategy
- Overseeing reporting, audit, and verification processes
- Overseeing and guiding the development of a business strategy

(4.1.2.7) Please explain

DNO's board has two subcommittees (with total of four directors serving on these two committees) which oversight environmental issues relevant to DNO in a complementary manner: a) the Health, Safety, Security and Environment (HSSE) Committee and b) the Audit Committee. The former is, among other things, in charge of overall supervision of environmental performance of the company while the latter focuses more on the regulatory and financial compliance as well as risks and opportunities aspects of environmental performance. Both Committees report to the wider board (by the chair, who is a director on the board), if necessary. Senior executives and managers from the company participate in the HSSE and Audit Committee meetings. Senior executives present at the HSSE Committee include the Managing Director (CEO/MD) and Head of Sustainability in addition to General Managers and HSSE Managers of DNO's two Business Units of Kurdistan region of Iraq and North Sea (covering Norway and the UK) and the Board Secretary. The HSSE Committee is a forum in which forward strategies are discussed and the Company's HSSE policy is adjusted, if necessary. Material presented at each meeting includes GHG, water and biodiversity related data and management measures which are discussed by the Committee at appropriate intervals to review performance and enable forward strategy setting. Additionally, the suite of projects to reduce our GHG emissions are discussed and endorsed at the Committee. Other GHG emissions related topics discussed in the Committee include internal price on GHG, GHG verification standards and methodologies, Company's GHG emissions targets and developments in the regulatory environment applicable to DNO

operations and energy transition. An example of a climate-related issue which was recently discussed in committee is historical and forecasted GHG emissions performance of DNO's operated as well as non-operated assets and strategies to manage emissions going forward.

(4.3.1.6) Please explain

In DNO, the CEO (or what we refer to in DNO terminology as the Managing Director or MD) has the management responsibility for Health, Safety, Security and Environment (HSSE) including climate related issues. DNO believes that primary responsibility for all HSSE matters, including climate related issues, should be with line management. As the two Business Units' (BU) General Managers (GM) report directly to the CEO, this set-up provides for clear accountability and quick decision making. In turn, operational management of emissions is the responsibility of each BU General Manager who must ensure compliance with DNO's HSSE Policy Statement, which includes the requirement to "promote the reduction of emissions and pollution from our operations" and must aim to meet goals that are set on an

annual basis, including emissions related targets. The CEO chairs a quarterly HSSE review, at which the GMs report their BU's environmental performance, including GHG emissions. Water and biodiversity are also discussed as relevant, but at least once a year. Progress is measured against Company's plans and targets and performance of peers. Where necessary, actions are agreed to improve performance and/or proposals to adjust strategy are formulated for discussion with the board HSSE Committee. In addition, the CEO chairs a monthly review of the GHG emission reduction projects in all DNO operated assets. The meeting reviews status of projects in the planning and execution phases, identifying corrective actions where necessary, and it reviews the next set of potential projects and ideas to prioritise their implementation. The CEO has overall responsibility for climate transition assessment, planning and where relevant implementation. Additionally, the CEO oversees the climate-related targets of the company.

Targets

Achievement of environmental targets

Emission reduction

Implementation of an emissions reduction initiative

Reduction in emissions intensity

(4.5.1.4) Incentive plan the incentives are linked to

Select from:

Both Short-Term and Long-Term Incentive Plan, or equivalent

(4.5.1.5) Further details of incentives

The incentives include both bonus as percentage of salary and award of synthetic shares (with two, three or five year vesting period). This covers both short term (less than one year in DNO's planning horizon) and medium term (1-5 years).

(4.5.1.6) How the position's incentives contribute to the achievement of your environmental commitments and/or climate transition plan

The Chief Executive Officer (CEO, or what we refer to in DNO terminology as the Managing Director or MD) together with the two General Managers (GM) of the Business Units (BU) as well as the Corporate Head of Sustainability are responsible for the accurate monitoring and disclosure of climate-related performance data. Delivering on agreed plans and projects (including to improve energy and emissions performance, prevention of air and water pollution incidents, and reducing water usage to the extent possible within the operational limitations) fall specifically on the General Managers of DNO's two business units (Kurdistan region of Iraq and North Sea). These two positions are considered C-level positions (part of executive management team) in DNO. They report directly to DNO's Chief Executive Officer (or what we refer to in DNO terminology as the Managing Director or MD). Environmental performance of their business unit is included in their overall annual performance appraisal, which is the basis for their bonus, salary adjustment and share incentive programs (monetary reward). A prime example of a major multi-year GHG reduction initiative which was delivered during 2020-2023 by DNO's Kurdistan Business Unit, led by its General Manager, is reduction of flaring of associated gas at DNO's Peshkabir field. This was a USD 140 million project which has significantly improved DNO's GHG emissions performance (flare and GHG reduction by over 70%). The incentives include both bonus as % of salary and award of synthetic shares (with two, three or five year vesting period). This covers both short term (less than one year in DNO's planning horizon) and medium term (1-5 years).

(4.6.1.4) Explain the coverage

DNO's Greenhouse Gas (GHG) Emissions Management Policy: This policy document sets out both the vision and the high-level requirements for management of GHG emissions, including quantification and reporting, across the DNO Group. Management of GHG emissions is an important part of DNO's environmental commitments notably to minimize undesirable effects on the environment resulting from our activities. This policy establishes the vision and minimum requirements for managing (i.e., quantifying, reporting, reducing and forecasting of) GHG emissions associated with DNO's activities and assets. It sets the requirement to monitor, account for, report, forecast and aim to reduce Scope 1, and the relevant subcategories of Scopes 2 and 3 GHG emissions from all of the operated licenses. Additionally, DNO should make best efforts to do so for its non-operated licenses. Overall principles set in this policy are: 1. no venting in routine operations; 2. all GHG emissions should be reduced consistent with the As Low As Reasonably Practicable (ALARP) and the materiality criteria; 3. minimizing (and aiming to eliminate) flaring of hydrocarbons; 4. fuel switching in favour of less-GHG intensive energy sources; 5. minimizing fugitive methane emissions; and 6. promoting and implementing low GHG emissions initiatives. This policy covers all of DNO's activities (i.e., no geographical or business activity exceptions).

(4.6.1.5) Environmental policy content

Environmental commitments

- Commitment to comply with regulations and mandatory standards

Climate-specific commitments

- Commitment to zero flaring
- Other climate-related commitment, please specify :• No venting in routine operations • All GHG emissions should be reduced consistent with the As Low As Reasonably Practicable (ALARP) and materiality criteria • Fuel switching in favour of less GHG intensive fuels and minimizing methane emissions

(4.6.1.6) Indicate whether your environmental policy is in line with global environmental treaties or policy goals

(4.6.1.4) Explain the coverage

DNO's Water Management Policy: This policy sets out both the vision and the high-level requirements for water use management in DNO Group, including quantification and reporting. Water use management is an important part of DNO's environmental commitments, notably to prevent pollution and minimize the impact of our operations on the environment and biodiversity and reduce freshwater use especially in water-stressed areas. Availability of water which meets relevant standards is essential for multiple activities of DNO, namely staff use, drilling, and processing of produced hydrocarbons, in addition for the wellbeing of DNO's neighbouring communities in the case of scarce water resources. This policy applies across the DNO Group. It establishes the vision and minimum requirements for managing (i.e., monitoring, quantifying, reporting and conserving) water use, especially freshwater, in DNO's field activities (i.e., operated assets). In addition, the Company should engage with the operators of its non-operated assets with the aim that this policy is adhered to. This policy covers all of DNO's activities (i.e., no geographical or business activity exceptions).

(4.6.1.5) Environmental policy content

Environmental commitments

- Commitment to comply with regulations and mandatory standards

Water-specific commitments

- Commitment to control/reduce/eliminate water pollution
- Commitment to reduce water consumption volumes
- Commitment to reduce water withdrawal volumes
- Commitment to safely managed WASH in local communities
- Other water-related commitment, please specify :• Water use in DNO's activities should be monitored, quantified, reported and reduced, to the extent practically possible, especially in areas facing water stress risk. Although water use in absolute terms may increase over time depending on activity

(4.6.1.6) Indicate whether your environmental policy is in line with global environmental treaties or policy goals

Select all that apply

- No, and we do not plan to align in the next two years

(4.6.1.7) Public availability

Select from:

- Not publicly available

Row 4

(4.6.1.1) Environmental issues covered

Select all that apply

- Biodiversity

(4.6.1.2) Level of coverage

Select from:

- Organization-wide

(4.6.1.3) Value chain stages covered

Select all that apply

- Direct operations
- Portfolio

(4.6.1.4) Explain the coverage

DNO's Biodiversity Management Policy: This policy sets out both the vision and the high-level requirements for biodiversity management in DNO Group. Biodiversity management is an important part of DNO's environmental commitments, notably to prevent pollution and minimize the impact of our operations on the environment and biodiversity. The policy applies across the DNO Group. It establishes the vision and minimum requirements for managing (i.e., assessing, monitoring, protecting and reporting) biodiversity in connection with DNO's field activities (i.e., operated assets). In addition, the Company should engage with the operators of its non-operated assets with the aim that this policy is adhered to. This policy covers all of DNO's activities (i.e., no geographical or business activity exceptions).

(4.6.1.5) Environmental policy content

Environmental commitments

- Commitment to avoidance of negative impacts on threatened and protected species
- Commitment to comply with regulations and mandatory standards
- Commitment to take environmental action beyond regulatory compliance
- Commitment to respect legally designated protected areas

Other environmental commitment, please specify :• Impacts of our operations (notably new activities) on biodiversity should be assessed, monitored (including establishing baselines), reported and minimized (to the extent practically possible), especially in areas with elevated biodiversity risks.

(4.10) Are you a signatory or member of any environmental collaborative frameworks or initiatives?

(4.10.1) Are you a signatory or member of any environmental collaborative frameworks or initiatives?

Select from:

Yes

(4.10.2) Collaborative framework or initiative

Select all that apply

Other, please specify :Aiming for Zero Methane Emissions Initiative (<https://aimingforzero.ogci.com/>) AND Methane Guiding Principles (MGP, <https://methaneguidingprinciples.org/>),

(4.10.3) Describe your organization's role within each framework or initiative

In addition to its efforts to reduce CO2 emissions, DNO has been working on reducing its methane emissions, a potent GHG. Since 2022, DNO has been a signatory of the Aiming for Zero Methane Emissions Initiative (<https://aimingforzero.ogci.com/>), an oil and gas industry pledge coordinated by the OGCI (Oil and Gas Climate Initiative), to reach near zero methane emissions from the Company's operated oil and gas assets by 2030 and actively work with its partners in its non-operated assets to achieve the same. In 2023, DNO joined the Methane Guiding Principles (MGP, <https://methaneguidingprinciples.org/>), a coalition of industry and civil society organizations to reduce methane emissions across the oil and gas global supply chain. The MGP members develop and share practical tools and guidance to help others to learn from their experience and put those lessons into practice.

[Fixed row]

(4.11) In the reporting year, did your organization engage in activities that could directly or indirectly influence policy, law, or regulation that may (positively or negatively) impact the environment?

(4.11.1) External engagement activities that could directly or indirectly influence policy, law, or regulation that may impact the environment

Select all that apply

Yes, we engaged indirectly through, and/or provided financial or in-kind support to a trade association or other intermediary organization or individual whose activities could influence policy, law, or regulation

(4.11.2) Indicate whether your organization has a public commitment or position statement to conduct your engagement activities in line with global environmental treaties or policy goals

Select from:

No, and we do not plan to have one in the next two years

(4.11.5) Indicate whether your organization is registered on a transparency register

Select from:

No

(4.11.8) Describe the process your organization has in place to ensure that your external engagement activities are consistent with your environmental commitments and/or transition plan

The quarterly board HSSE committee meetings include two board members, the Chief Executive Officer (or what we refer to in DNO terminology as the Managing Director or MD), and the General Managers of DNO's business units, in addition to Corporate Head of Sustainability. Through having all strategy discussions at the

highest levels of the company and with the relevant senior executives actively involved, we ensure that any engagement with policy makers by company representatives is with a full understanding of DNO's goals concerning climate change including emissions management and consistent with expectations of the executive team and the board. Results of any such engagements are reported when relevant/ significant and adjustments are made if deemed necessary.
[Fixed row]

C5. Business strategy

(5.1) Does your organization use scenario analysis to identify environmental outcomes?

Climate change

(5.1.1) Use of scenario analysis

Select from:

Yes

(5.1.2) Frequency of analysis

Select from:

Annually

Water

(5.1.1) Use of scenario analysis

Select from:

No, and we do not plan to within the next two years

(5.1.3) Primary reason why your organization has not used scenario analysis

Select from:

Judged to be unimportant or not relevant

(5.1.4) Explain why your organization has not used scenario analysis

We have operations in three countries regions Norway the UK and Kurdistan region of Iraq Water is not considered a scarce resource in Norway or the UK in our short medium and long-term planning horizons In the Kurdistan region of Iraq availability of water for our operations is not assessed to be an insignificant risk to our business. This is because we have not faced any difficulties with securing water for our operations (both from a nearby river and water wells) and we have no reason

to believe this will change within our planning horizon (the relevant ones being short and medium terms, thus less than five years). Therefore, due to insignificance of the water availability risk for our operations we do have not implemented scenario analysis for water yet and not planning to do so in the next two years. But we will assess water availability risks at least once a year and consider using scenario analysis if warranted.

[Fixed row]

(5.1.1) Provide details of the scenarios used in your organization's scenario analysis.

- Other regulators, legal and policy regimes driving forces, please specify :CO2 (GHG) pricing

(5.1.1.10) Assumptions, uncertainties and constraints in scenario

DNO conducted a series of climate-related sensitivity analysis to assess potential value of its assets under certain climate-related scenarios and disclosed the results in its 2023 Annual Report. DNO used three widely cited scenarios for oil, gas, and GHG pricing development until 2050 prescribed in the International Energy Agency's (IEA) 2023 World Energy Outlook: Stated Policies (STEPS), Announced Pledges (APS) and Net Zero by 2050 (NZE 2050). The NZE 2050 scenario is a 1.4 C pathway (reference IEA). Its key assumptions used in DNO's analysis include: • oil price of USD 42 per barrel in 2030 and USD 25 per barrel in 2050 (in 2022 real terms). DNO used linear extrapolation for years between now and 2050. • Natural gas price of USD 4.3 per MMBtu in 2030 and USD 4.1 per MMBtu in 2050 (in 2022 real terms). DNO used linear extrapolation for other years. • GHG pricing in Norway of USD 240 /tCO₂e by 2030 consistent with the Norwegian government's proposal (in 2021 real terms). DNO assumed the GHG price in Norway will increase at two percent (nominal) afterwards. For GHG pricing in Kurdistan region of Iraq, we assumed USD 15/tCO₂ in 2030, USD 35/tCO₂ in 2040 and USD 55/tCO₂ in 2050 (in 2022 real terms) based on IEA. DNO used linear extrapolation for other years.

(5.1.1.11) Rationale for choice of scenario

We have used IEA's scenarios which are widely respected and used in the energy sector (the most relevant to our industry)

Climate change

(5.1.2.1) Business processes influenced by your analysis of the reported scenarios

Select all that apply

- Risk and opportunities identification, assessment and management
- Strategy and financial planning
- Resilience of business model and strategy
- Target setting and transition planning

(5.1.2.2) Coverage of analysis

Select from:

- Organization-wide

(5.1.2.3) Summarize the outcomes of the scenario analysis and any implications for other environmental issues

As the oil and gas price assumptions in the IEA's Stated Policies Scenario were higher compared to DNO's long-term price assumptions, no impairments (also known as "write off") were observed under this scenario for DNO's portfolio. Climate sensitivity analysis using IEA's Announced Pledges scenario: As the oil and gas price assumptions in the IEA's Announced Pledges Scenario were higher compared to DNO's long-term price assumptions, no impairments (also known as "write off") were observed under this scenario for DNO's portfolio. Climate sensitivity analysis using IEA's Net Zero 2050 scenario: Results indicated potential impairment (commonly known as "write off" outside the financial community) of USD 127 million (post-tax) on DNO assets. These climate-related sensitivity analyses indicated that DNO's portfolio is resilient under these assumptions (to put numbers in perspective, DNO's market capitalization currently stands above USD 1 billion. Therefore, a hypothetical impairment of USD 127 million is not deemed significant). Also, our scenario analysis revealed that the main factor for company's valuation is not the CO2 price itself (in the form of higher operating cost) but the oil and gas prices resulting from changes to demand under the IEA scenarios. DNO plans to repeat this sensitivity analysis exercise at least once a year and report the results to the senior management as well as the board of directors of the company. We will also expand the scope of the scenario analysis if deemed appropriate, in order to ensure its business remains well placed for energy transition and climate change. The results of the sensitivity analysis, therefore have not changed our business strategy. We are mindful of scenarios for future oil, gas and GHG prices and we continue to consider them in our business planning.

[Fixed row]

(5.2) Does your organization's strategy include a climate transition plan?

(5.2.1) Transition plan

Select from:

- No, but we are developing a climate transition plan within the next two years

(5.2.15) Primary reason for not having a climate transition plan that aligns with a 1.5°C world

Select from:

- Not an immediate strategic priority

(5.2.16) Explain why your organization does not have a climate transition plan that aligns with a 1.5°C world

DNO supports the goals of the Paris Agreement to limit global warming to well below 2C and pursue efforts to limit it to 1.5C. We currently do not have an explicit energy transition strategy to achieve net zero by 2050, primarily because all of our oil and gas licenses will expire well before 2050. However, we have been very focused on reducing our scope 1 GHG emissions in the near and medium terms (

(5.3.1.3) Describe how environmental risks and/or opportunities have affected your strategy in this area

As described details in Section 7 of this disclosure, production from our Peshkabir field in the Tawke license in Kurdistan (Iraq) commenced in 2017. However, oil from this field had higher than expected associated gas content. Instead of flaring the associated gas, DNO made the strategic decision to invest in gas processing facilities to avoid flaring and instead inject gas underground and avoid significant GHG emissions. A project to process the associated gas produced from the Peshkabir field, and to transport it for injection at the nearby Tawke field (both fields are located in the Tawke license) became attractive both for strategical and financial reasons with the lens of climate change and energy transition. Phase 1 of the gas injection project was completed in 2020, followed by phase 2 in early 2023. With a capital cost of over USD 135 million, this project remains our largest single capital expenditure in this license in the Kurdistan region of Iraq. This project has enabled us to avoid emitting more than 1.4 million tonnes of CO2 from start up in 2020 to end 2023 (applicable to this disclosure). Without this project, emissions intensity of the Tawke license (i.e., GHG emissions per barrel of oil produced) would have been more than double in 2023. Therefore, this investment has allowed us to produced oil from this license at an emissions intensity (about 10 kgCO2e/barrel) which compares very favourably to the global upstream average (about 20 kgCO2e/barrel). This project remains the only gas injection project in Kurdistan region of Iraq. DNO is also actively pursuing a range of other GHG reduction projects in its operations (examples are diesel-to gas fuel switching and assessing use of offshore wind to power offshore production facilities). These projects, although come at a cost, enable DNO to maintain its low GHG intensity compared to its peers.

[Add row]

(5.3.2) Describe where and how environmental risks and opportunities have affected your financial planning.

Row 1

(5.3.2.1) Financial planning elements that have been affected

Select all that apply

- Climate change
- Water

(5.3.2.4) Describe how environmental risks and/or opportunities have affected these financial planning elements

Risk and opportunities (direct costs and capital expenditure): Production from Peshkabir field in Tawke license in Kurdistan commenced in 2017. Oil from this field had higher than expected associated gas content. DNO decided to turn this climate-related risk into an opportunity (producing low-emissions oil compared to its peers and manage reservoir pressure at the same time). Therefore, a project to process associated gas produced from Peshkabir, and to transport it for injection at nearby Tawke field (both fields are in the Tawke license) was sanctioned for cost of USD 135 million. This project has enabled us to avoid emitting more than 1.4 million tonnes of CO₂e from start up in 2020 to 2023. This project is forecasted to increase the oil recovery from the license by about 23 million barrels of oil (equivalent to revenues of over USD 1.6 billion at assumed oil price of USD 70). Elsewhere, DNO is actively pursuing a range of other GHG reduction projects (examples are diesel-to-gas fuel switching and assessing use of offshore wind to power offshore production facilities). These projects, although come at a cost, will enable DNO to maintain its low GHG intensity compared to its peers. Some of these project (e.g., fuel switching from more expensive diesel to otherwise-flared associated gas) have a net economic benefit to DNO over their lifetime, resulting in financial gains for DNO (thus turning a climate-related risk into an opportunity). Risks and opportunities (access to capital): Over the past several years, DNO has experienced an increasing number of environmental-related enquiries (e.g., CO₂ and methane emissions, water use, biodiversity protection) from existing and prospective investors (shareholders and bond holders), banks, financial institutions, and insurance companies, collectively referred to here as the financial community. DNO recognizes that in order to maintain access to quality financial services and attract investors, it needs to be transparent on its climate and more recently, water-related performance (as well as its performance in other areas of ESG). To address this, we have expanded our environmental disclosures with a focus on climate change and water security (among others such as waste). With transparent disclosure and focus on actions and results, DNO has been managing risk of restricted access to financial community. DNO's efforts have likely lowered cost of financing (although not possible to reliably quantify).

(5.4.1.11) Percentage share of financial metric that is taxonomy non-eligible in the reporting year (%)

100

(5.4.1.12) Details of the methodology or framework used to assess alignment with your organization's climate transition

An economic activity qualifies for taxonomy eligibility when it aligns with the activity description in the EU Taxonomy Regulation. To determine eligible activities within DNO, we have reviewed DNO's operations, products and sustainability initiatives, comparing them to the descriptions of economic activities outlined in the EU Taxonomy Regulation. It was determined that the Company's activities, which are all related to the core business of extracting and selling oil and gas, do not meet the eligibility criteria under the EU Taxonomy Regulation. As DNO does not have any eligible activities, it does not have any activities that meet the alignment criteria

under the EU Taxonomy Regulation. Therefore, revenue and turnover in this category in reporting year (2023) were zero, both for alignment and eligibility. Based on our current firm business plans, we do not expect these numbers to materially change by 2030.

(5.4.1.9) Percentage share of selected financial metric planned to align in 2030 (%)

0

(5.4.1.10) Percentage share of financial metric that is taxonomy-eligible in the reporting year (%)

0

(5.4.1.11) Percentage share of financial metric that is taxonomy non-eligible in the reporting year (%)

100

(5.4.1.12) Details of the methodology or framework used to assess alignment with your organization's climate transition

An economic activity qualifies for taxonomy eligibility when it aligns with the activity description in the EU Taxonomy Regulation. To determine eligible activities within DNO, we have reviewed DNO's operations, products and sustainability initiatives, comparing them to the descriptions of economic activities outlined in the EU Taxonomy Regulation. It was determined that the Company's activities, which are all related to the core business of extracting and selling oil and gas, do not meet the eligibility criteria under the EU Taxonomy Regulation. As DNO does not have any eligible activities, it does not have any activities that meet the alignment criteria under the EU Taxonomy Regulation. Therefore, capital cost (CAPEX) reported in this category in reporting year (2023) was zero, both for alignment and eligibility. Based on our current firm business plans, we do not expect these numbers to materially change by 2030.

Row 3

(5.4.1.1) Methodology or framework used to assess alignment

Select from:

A sustainable finance taxonomy

(5.4.1.2) Taxonomy under which information is being reported

Select from:

EU Taxonomy for Sustainable Activities

(5.4.1.3) Objective under which alignment is being reported

Select from:

Climate change mitigation

(5.4.1.4) Indicate whether you are reporting eligibility information for the selected objective

Select from:

Yes

(5.4.1.5) Financial metric

Select from:

OPEX

(5.4.1.6) Amount of selected financial metric that is aligned in the reporting year (currency)

0

(5.4.1.7) Percentage share of selected financial metric aligned in the reporting year (%)

0

(5.4.1.8) Percentage share of selected financial metric planned to align in 2025 (%)

0

(5.4.1.9) Percentage share of selected financial metric planned to align in 2030 (%)

0

(5.4.1.10) Percentage share of financial metric that is taxonomy-eligible in the reporting year (%)

(5.4.1.11) Percentage share of financial metric that is taxonomy non-eligible in the reporting year (%)

100

(5.4.1.12) Details of the methodology or framework used to assess alignment with your organization's climate transition

An economic activity qualifies for taxonomy eligibility when it aligns with the activity description in the EU Taxonomy Regulation. To determine eligible activities within DNO, we have reviewed DNO's operations, products and sustainability initiatives, comparing them to the descriptions of economic activities outlined in the EU Taxonomy Regulation. It was determined that the Company's activities, which are all related to the core business of extracting and selling oil and gas, do not meet the eligibility criteria under the EU Taxonomy Regulation. As DNO does not have any eligible activities, it does not have any activities that meet the alignment criteria under the EU Taxonomy Regulation. Therefore, operating cost (OPEX) reported in this category in reporting year (2023) was zero, both for alignment and eligibility. Based on our current firm business plans, we do not expect these numbers to materially change by 2030.

[Add row]

(5.4.3) Provide any additional contextual and/or verification/assurance information relevant to your organization's taxonomy alignment.

	Additional contextual information relevant to your taxonomy accounting	Indicate whether you will be providing verification/assurance information relevant to your taxonomy alignment in question 13.1
	<i>We report on EU Taxonomy as part of our annual report, which is audited by a third-party auditor.</i>	Select from: <input checked="" type="checkbox"/> Yes

[Fixed row]

(5.5) Does your organization invest in research and development (R&D) of low-carbon products or services related to your sector activities?

(5.5.1) Investment in low-carbon R&D

Select from:

Yes

(5.5.2) Comment

In 2023, DNO did not have any inhouse research and development activities on low-carbon projects. However, DNO had indirect low-carbon research and development activities through its membership in the Low Emission Center in Norway. Through this center, DNO has contributed to research and development efforts for improving environmental performance of the offshore oil and gas industry. This center, which is supported by the Norwegian government and universities as well as the industry, develops new technologies for offshore energy systems and integration with renewable power production technologies.

[Fixed row]

(5.5.7) Provide details of your organization's investments in low-carbon R&D for your sector activities over the last three years.

Row 1

(5.5.7.1) Technology area

Select from:

Unable to disaggregate by technology area

(5.5.7.3) Average % of total R&D investment over the last 3 years

12

(5.5.7.4) R&D investment figure in the reporting year (unit currency as selected in 1.2) (optional)

105000

(5.5.7.5) Average % of total R&D investment planned over the next 5 years

12

(5.5.7.6) Explain how your R&D investment in this technology area is aligned with your climate commitments and/or climate transition plan

DNO has been a member of the SINTEF Low Emission Center in Norway, through which DNO has been contributing to research and development efforts for improving environmental performance of the offshore oil and gas industry. This center develops new technologies for offshore energy systems and integration with renewable power production technologies. Our contribution to SINTEF totalled USD 0.3 million over 2021-2023 compared to total R&D expenditure of USD 2.5 million, therefore about 12% of total R&D expenditure. We expect this value to be around 15% over the next five years.

[Add row]

(5.6) Break down, by fossil fuel expansion activity, your organization's CAPEX in the reporting year and CAPEX planned over the next 5 years.

Exploration of new oil fields

(5.6.4) Explain your CAPEX calculations, including any assumptions

In addition to inherent uncertainties in the upstream oil and gas sector investment environment (driven by multiple factors such as success of exploration activities, oil and gas prices, other commodity prices, global and regional supply and demand developments, and evolving regulatory environments), which make providing reliable numbers very challenging, the requested data can include confidential and market sensitive information; therefore, we cannot answer this question.

Exploration of new natural gas fields

(5.6.4) Explain your CAPEX calculations, including any assumptions

In addition to inherent uncertainties in the upstream oil and gas sector investment environment (driven by multiple factors such as success of exploration activities, oil and gas prices, other commodity prices, global and regional supply and demand developments, and evolving regulatory environments), which make providing reliable numbers very challenging, the requested data can include confidential and market sensitive information; therefore, we cannot answer this question.

Expansion of existing oil fields

(5.6.4) Explain your CAPEX calculations, including any assumptions

In addition to inherent uncertainties in the upstream oil and gas sector investment environment (driven by multiple factors such as success of exploration activities, oil and gas prices, other commodity prices, global and regional supply and demand developments, and evolving regulatory environments), which make providing reliable numbers very challenging, the requested data can include confidential and market sensitive information; therefore, we cannot answer this question.

Expansion of existing natural gas fields

(5.6.4) Explain your CAPEX calculations, including any assumptions

In addition to inherent uncertainties in the upstream oil and gas sector investment environment (driven by multiple factors such as success of exploration activities, oil and gas prices, other commodity prices, global and regional supply and demand developments, and evolving regulatory environments), which make providing reliable numbers very challenging, the requested data can include confidential and market sensitive information; therefore, we cannot answer this question.

[Fixed row]

(5.9) What is the trend in your organization's water-related capital expenditure (CAPEX) and operating expenditure (OPEX) for the reporting year, and the anticipated trend for the next reporting year?

(5.9.1) Water-related CAPEX (+/- % change)

0

(5.9.2) Anticipated forward trend for CAPEX (+/- % change)

0

(5.9.3) Water-related OPEX (+/- % change)

0

(5.9.4) Anticipated forward trend for OPEX (+/- % change)

0

(5.9.5) Please explain

Our water-related CAPEX and OPEX (e.g., cost of procuring water for our staff and operations) in 2023 were negligible (below 1%) compared to our total OPEX and CAPEX in the reporting year and the same is expected for the next reporting year. The change in water-related CAPEX and OPEX in 2023 was also insignificant (thus chosen 0%) compared to 2022 levels. We expect the same (no change) going forward for both CAPEX and OPEX. Note that these numbers exclude capital and

operating cost associated with processing of water produced during oil production and injection of the produced water back into the underground reservoir. This exclusion is because these expenses are not water-related. In other words, they are part of oil production process.

[Fixed row]

(5.10) Does your organization use an internal price on environmental externalities?

	Use of internal pricing of environmental externalities	Environmental externality priced
	Select from: <input checked="" type="checkbox"/> Yes	Select all that apply <input checked="" type="checkbox"/> Carbon

[Fixed row]

(5.10.1) Provide details of your organization's internal price on carbon.

Row 1

(5.10.1.1) Type of pricing scheme

Select from:

- Shadow price

(5.10.1.2) Objectives for implementing internal price

Select all that apply

- Conduct cost-benefit analysis
- Identify and seize low-carbon opportunities
- Navigate regulations
- Stress test investments

(5.10.1.3) Factors considered when determining the price

Select all that apply

- Alignment with the price of a carbon tax
- Alignment with the price of allowances under an Emissions Trading Scheme
- Benchmarking against peers
- Existing or pending legislation
- Scenario analysis

(5.10.1.4) Calculation methodology and assumptions made in determining the price

DNO uses the Stated Policies Scenario of the International Energy Agency (IEA) as prescribed in IEA's latest (2030) World Energy Outlook as the basis for its internal carbon price, in addition to the guidelines of the host governments where it operates.

(5.10.1.5) Scopes covered

Select all that apply

- Scope 1

(5.10.1.6) Pricing approach used – spatial variance

Select from:

- Differentiated

(5.10.1.7) Indicate how and why the price is differentiated

The internal price on carbon varies across our portfolio based on the geography.

(5.10.1.8) Pricing approach used – temporal variance

Select from:

- Evolutionary

(5.10.1.9) Indicate how you expect the price to change over time

We expect the internal carbon price to increase in the long term, although the pace and extent of which are uncertain.

(5.10.1.10) Minimum actual price used (currency per metric ton CO2e)

0

(5.10.1.11) Maximum actual price used (currency per metric ton CO2e)

240

(5.10.1.12) Business decision-making processes the internal price is applied to

Select all that apply

- Capital expenditure
- Operations
- Risk management

(5.10.1.13) Internal price is mandatory within business decision-making processes

Select from:

- Yes, for all decision-making processes

(5.10.1.14) % total emissions in the reporting year in selected scopes this internal price covers

100

(5.10.1.15) Pricing approach is monitored and evaluated to achieve objectives

Select from:

- Yes

(5.10.1.16) Details of how the pricing approach is monitored and evaluated to achieve your objectives

DNO's internal price on carbon takes into account Stated Policies scenario of the International Energy Agency as well as any host governmental guidelines/ regulations. According to this IEA scenario, there is not going to be any carbon pricing in Kurdistan region of Iraq (our core area of production and thus emissions) until 2050. For Norway, we use the guideline of the Norwegian government (which is more stringent than IEA's numbers for Norway). We use an internal carbon price

of USD 240 /tCO2e by 2030 in Norway (in 2021 real terms) and we assume this price will increase at two percent (nominal) afterwards. We continue to monitor both regulatory (e.g., host governments) and policy/ academic (e.g., IEA) developments in terms of expected carbon pricing in our areas of operations and will update our internal carbon price accordingly.

[Add row]

(5.11) Do you engage with your value chain on environmental issues?

Suppliers

(5.11.1) Engaging with this stakeholder on environmental issues

Select from:

Yes

(5.11.2) Environmental issues covered

Select all that apply

Climate change

Water

Customers

(5.11.1) Engaging with this stakeholder on environmental issues

Select from:

No, and we do not plan to within the next two years

(5.11.3) Primary reason for not engaging with this stakeholder on environmental issues

Select from:

Judged to be unimportant or not relevant

(5.11.4) Explain why you do not engage with this stakeholder on environmental issues

With respect to customers and end-users (who make up the lion's share of our scope 3 emissions and irrelevant in terms of water use since our product does not contain any water), we believe DNO – with less than 0.1% of global oil and gas supply – has very limited ability to influence the customers and the oil market (and notably scope 3 emissions). Therefore, engaging with customers and end-users are judged not to be important or relevant for the next two years. We continue to monitor the developments and will adjust our strategy if warranted.

Investors and shareholders

(5.11.1) Engaging with this stakeholder on environmental issues

[Fixed row]

(5.11.1) Does your organization assess and classify suppliers according to their dependencies and/or impacts on the environment?

	Assessment of supplier dependencies and/or impacts on the environment
Climate change	<i>Select from:</i> <input checked="" type="checkbox"/> No, we do not currently assess the dependencies and/or impacts of our suppliers, but we plan to do so within the next two years
Water	<i>Select from:</i> <input checked="" type="checkbox"/> No, we do not currently assess the dependencies and/or impacts of our suppliers, but we plan to do so within the next two years

[Fixed row]

(5.11.2) Does your organization prioritize which suppliers to engage with on environmental issues?

Climate change

(5.11.2.1) Supplier engagement prioritization on this environmental issue

Select from:

- Yes, we prioritize which suppliers to engage with on this environmental issue

(5.11.2.2) Criteria informing which suppliers are prioritized for engagement on this environmental issue

Select all that apply

- Procurement spend
 Supplier performance improvement
 Regulatory compliance
 Reputation management
 Leverage over suppliers
 Strategic status of suppliers

(5.11.2.4) Please explain

We are in early stages of supplier engagement on climate related matters. We have started with GHG performance inquiries and data collection in our Norway and the UK operations. We plan to expand the scope to relevant suppliers in the next two years, especially as we implement requirements of European Union's Corporate Sustainability Reporting Directive (CSRD). DNO will be subject to CSRD from year 2024.

Water

(5.11.2.1) Supplier engagement prioritization on this environmental issue

Select from:

- Yes, we prioritize which suppliers to engage with on this environmental issue

(5.11.2.2) Criteria informing which suppliers are prioritized for engagement on this environmental issue

Select all that apply

- Procurement spend
- Regulatory compliance
- Reputation management
- Business risk mitigation
- Leverage over suppliers
- Strategic status of suppliers
- Product safety and compliance
- Supplier performance improvement

(5.11.2.4) Please explain

We are in early stages of supplier engagement on sustainability related matters, including water use. We have started with GHG performance inquiries and data collection in our Norway and the UK operations, but water is deemed to be far less relevant because these areas are not deemed water stressed. We plan to expand our supplier engagement to our other areas of operations (Kurdistan region of Iraq.) within the next two years, especially as we implement requirements of European Union's Corporate Sustainability Reporting Directive (CSRD). DNO will be subject to CSRD from year 2024.

[Fixed row]

(5.11.5) Do your suppliers have to meet environmental requirements as part of your organization's purchasing process?

Climate change

(5.11.5.1) Suppliers have to meet specific environmental requirements related to this environmental issue as part of the purchasing process

Select from:

No, and we do not plan to introduce environmental requirements related to this environmental issue within the next two years

(5.11.5.2) Policy in place for addressing supplier non-compliance

Select from:

Yes, we have a policy in place for addressing non-compliance

(5.11.5.3) Comment

We require strict due diligence before engaging with any supplier and to continue our engagements. The due diligence process includes multiple aspects such as adherence to relevant international and national environmental practices and regulations, in addition to DNO's own requirements (e.g., with respect to avoiding spills of hydrocarbons). Although we currently do not have specific requirements for our suppliers in terms of climate change and water use performance, we have started the engagement and ask for sustainability related information and data (e.g., direct GHG emissions and water usage) related to our activities from our relevant suppliers in Norway and the UK. We are planning to increase the scope of engagement to better understand their standings before introducing specific sustainability-related requirements. In other words, our initial focus is understanding their current status and future plans. In terms of compliance with general contractual obligations (beyond sustainability-related matters), we have strict policies in place requiring full compliance from our suppliers.

Water

(5.11.5.1) Suppliers have to meet specific environmental requirements related to this environmental issue as part of the purchasing process

[Add row]

(5.11.9) Provide details of any environmental engagement activity with other stakeholders in the value chain.

Climate change

(5.11.9.1) Type of stakeholder

Select from:

Other value chain stakeholder, please specify : The “other partners in the value chain” that are referred to here are the joint venture partners with which DNO works in its upstream projects.

(5.11.9.2) Type and details of engagement

Education/Information sharing

- Share information on environmental initiatives, progress and achievements

Innovation and collaboration

- Collaborate with stakeholders on innovations to reduce environmental impacts in products and services

(5.11.9.3) % of stakeholder type engaged

Select from:

- 76-99%

(5.11.9.4) % stakeholder-associated scope 3 emissions

Select from:

- None

(5.11.9.5) Rationale for engaging these stakeholders and scope of engagement

The “other partners in the value chain” that are referred to here are the joint venture partners (i.e., co-owners of assets) with which DNO works in its upstream projects. In the North Sea (Norway and the UK), DNO is operator in some of these joint ventures and non-operator in others. In the Kurdistan region of Iraq, DNO is operator in both of its licenses. In all joint ventures, we engage with partners on plans related to emissions reductions among other sustainability matters (e.g., reduction targets, disclosure requirements, long-term strategy). A case study on our climate-related engagement strategy: Over the last three years, we have been in close discussions with our joint venture partners in one of our GHG intensive oil and gas production licenses offshore Norway and the subject matter experts from the industry (including a leading technology provider from Norway) to install floating wind turbines to replace onsite gas turbines used for powering an offshore platform in an offshore oil and gas production license. This project can potentially result in 30% reduction in emissions. Due to its large capital expenditure and technology risk a final decision has not been made but technical work is ongoing. We have been engaging with financial community to potentially finance this project.

(5.11.9.6) Effect of engagement and measures of success

Our continuous engagement with Joint Venture partners on GHG emissions performance of our assets over the last five years have led to increased awareness and shared appetite for reducing emissions from our operations (as much as reasonably possible). In addition to emissions performance being part of most Joint Venture general meetings, focused groups and projects are defined to tackle specific issues (such as techno-economic assessment of and commercial negotiations on powering one of our offshore platforms with offshore wind turbines and various leak-detection-and repair campaigns to reduce methane emissions). In addition to

reducing emissions, these engagements have also led to more transparent and harmonized sharing of environmental performance data of various shared assets, which is a significant improvement compared to just a few years ago.

Water

(5.11.9.1) Type of stakeholder

C7. Environmental performance - Climate Change

(7.1) Is this your first year of reporting emissions data to CDP?

Select from:

No

(7.1.1) Has your organization undergone any structural changes in the reporting year, or are any previous structural changes being accounted for in this disclosure of emissions data?

	Has there been a structural change?
	Select all that apply <input checked="" type="checkbox"/> No

[Fixed row]

(7.1.2) Has your emissions accounting methodology, boundary, and/or reporting year definition changed in the reporting year?

(7.1.2.1) Change(s) in methodology, boundary, and/or reporting year definition?

Select all that apply

Yes, a change in methodology

(7.1.2.2) Details of methodology, boundary, and/or reporting year definition change(s)

We have improved our emissions accounting through using gas compositional analysis to more accurately quantify GHG emissions from associated gas combustion and flaring in our operations in the Kurdistan region of Iraq (our core area of operations in 2023).

[Fixed row]

(7.1.3) Have your organization's base year emissions and past years' emissions been recalculated as a result of any changes or errors reported in 7.1.1 and/or 7.1.2?

(7.1.3.1) Base year recalculation

Select from:

No, because the impact does not meet our significance threshold

(7.1.3.3) Base year emissions recalculation policy, including significance threshold

This change relates to improving quantification of associated gas flaring and combustion (fuel gas) in our Tawke license, which is mainly driven by gas production from the Peshkabir field. Peshkabir field came on production in 2017, two years after our base year for GHG emissions reporting (2015). Therefore, there is no need to change the emissions of our base year (2015) (this field and its emissions did not exist in our base year, therefore, change in methodology does not change emissions of the base year).

(7.1.3.4) Past years' recalculation

Select from:

No

[Fixed row]

(7.2) Select the name of the standard, protocol, or methodology you have used to collect activity data and calculate emissions.

Select all that apply

IPCC Guidelines for National Greenhouse Gas Inventories, 2006

IPIECA's Petroleum Industry Guidelines for reporting GHG emissions, 2nd edition, 2011

- The Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard (Revised Edition)
- Other, please specify :Alberta greenhouse gas quantification methodologies, version 2.3, year 2023

(7.3) Describe your organization's approach to reporting Scope 2 emissions.

(7.3.1) Scope 2, location-based

Select from:

- We are reporting a Scope 2, location-based figure

(7.3.2) Scope 2, market-based

Select from:

- We have operations where we are able to access electricity supplier emission factors or residual emissions factors, but are unable to report a Scope 2, market-based figure

(7.3.3) Comment

In 2023, DNO had field operations and offices in Norway, the UK, the UAE and the Kurdistan region of Iraq. We purchased electricity in all four countries for our offices. While the electricity markets are fairly developed in Norway, the UK and the UAE, accessing emissions data (especially market-based emissions) from the power sector in Kurdistan is currently impossible/ very uncertain.

[Fixed row]

(7.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1, Scope 2 or Scope 3 emissions that are within your selected reporting boundary which are not included in your disclosure?

Select from:

- No

(7.5) Provide your base year and base year emissions.

[Fixed row]

(7.6) What were your organization's gross global Scope 1 emissions in metric tons CO2e?

	Gross global Scope 1 emissions (metric tons CO2e)	Methodological details
Reporting year	247191	Scope 1 emissions are from our operated assets (and all of our offices) on a gross basis. All emissions are verified by a third-party.

[Fixed row]

(7.7) What were your organization's gross global Scope 2 emissions in metric tons CO2e?

Reporting year

(7.7.1) Gross global Scope 2, location-based emissions (metric tons CO2e)

383

(7.7.4) Methodological details

Scope 2 quantification is based on actual electricity purchased (for all locations except Erbil office) and estimated electricity purchased (for Erbil office, where the office does not have a standalone meter). GHG intensity factors for scope 2 quantification are based on what the electricity suppliers have provided (where available) and average intensity of the electricity grid of the host country.

[Fixed row]

(7.8) Account for your organization's gross global Scope 3 emissions, disclosing and explaining any exclusions.

Purchased goods and services

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

Until this year, DNO has been very focused quantifying the emissions which it has direct control of and can most effectively reduce (thus scope 1). DNO, as company with international operations, uses a very wide range of goods and services providers (from small local firms in rural areas of Iraq to multi-national service companies with offices and staff around the world). Only a few of these suppliers (i.e., not all) publish and disclose their emissions data - let alone product or service specific emissions data. Therefore, quantifying these emissions data has not been a priority so far (due to less reliability and our limited ability to impact those emissions). However, DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Capital goods

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

Until this year, DNO has been very focused quantifying the emissions which it has direct control of and can most effectively reduce (thus scope 1). Calculating the lifecycle emissions of capital goods would be a massive task because of the very wide range of capital goods (and services) acquired by DNO (some goods can even be purchased as used/ second-hand), the diversity of our suppliers (from small companies in Iraq to multi-national service companies with offices and staff spread around the world) and the fact that only a few of the suppliers (not all) publish and disclose their emissions data - let alone emissions data for specific products. Therefore, quantifying these emissions data has not been a priority so far (due to less reliability and our limited ability to impact those emissions). However, DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Fuel-and-energy-related activities (not included in Scope 1 or 2)

(7.8.1) Evaluation status

Select from:

Not relevant, explanation provided

(7.8.5) Please explain

Direct emissions from our fuel use (e.g. by field vehicles and for onsite electricity and process heat generation) are already accounted for and reported under our Scope 1 emissions.

Upstream transportation and distribution

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

Until this year, DNO has been very focused quantifying the emissions which it has direct control of and can most effectively reduce (thus scope 1). Calculating the emissions associated with upstream transportation and distribution of supplies to DNO would be a huge task because of the very wide range of goods purchased by DNO, the multiple transportation/ distribution routes, and the multiple companies involved in each transportation/ distribution activity. Therefore, quantifying these emissions data has not been a priority so far (due to low reliability and our limited ability to impact those emissions). However, DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Waste generated in operations

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

Until this year, DNO has been very focused quantifying the emissions which it has direct control of and can most effectively reduce (thus scope 1 emissions). DNO's activities produces various waste streams, which we responsibly handle and disposes according to applicable regulations, internal policies and best practices. The emissions from transportation, disposal and when relevant, waste treatment are estimated to be very small compared with DNO's scopes 1-3 emissions so evaluation has not been prioritised yet. However, DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Business travel

(7.8.1) Evaluation status

Select from:

Relevant, calculated

(7.8.2) Emissions in reporting year (metric tons CO2e)

2808

(7.8.3) Emissions calculation methodology

Select all that apply

Distance-based method

(7.8.4) Percentage of emissions calculated using data obtained from suppliers or value chain partners

100

(7.8.5) Please explain

All flight-related emissions (under scope 3) are calculated based on distance travelled (based on flight itineraries provided by airlines) and relevant established emissions factors. Thus 100% of flight information (itineraries) are provided by travel agencies (airlines) but DNO uses factors to calculate GHG emissions (GHG emissions figures are calculated by DNO based on data acquired).

Employee commuting

(7.8.1) Evaluation status

Select from:

Not relevant, explanation provided

(7.8.5) Please explain

DNO has some staff who commute (on a regular basis) internationally to and from DNO's operations in the Kurdistan region of Iraq and (to a lower extent) DNO's offices in UAE, Norway and the UK. The emissions associated with the flights taken by these commuters are included under Scope 3 "business travel" and is not broken down to commuting and business travel. Emissions associated with daily/routine ground transport commutes are not calculated. DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Upstream leased assets

(7.8.1) Evaluation status

Select from:

Not relevant, explanation provided

(7.8.5) Please explain

There can be two subcategories in this group which can apply to DNO: emissions from leased vehicles for transportation of staff within the city of Erbil (for Kurdistan operations) and any direct emissions from drilling activities. Both of these emissions are already accounted for and reported under our Scope 1 emissions.

Downstream transportation and distribution

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

DNO's operated oil and gas production in Kurdistan region of Iraq and Norway and the UK is transferred to third party owned pipeline networks, marine vessels and road tankers for onward transportation to market. The emissions from such transportation systems are not yet calculated due to the complexity of these systems. DNO is not able to access the energy use and emissions data from its most important (largest) downstream transportation systems (road tankers and the Iraq/Türkiye oil pipeline applicable to our production in the Kurdistan region of Iraq). Therefore due to limited availability of reliable data, there has been little purpose for DNO to evaluate this category so far. However, DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).operated oil and gas production in Kurdistan region of Iraq and the North Sea is transferred to third party owned pipeline networks, marine vessels and road tankers for onward transportation to market. The emissions from such transportation systems are not yet calculated due to the complexity of these systems. DNO is not able to access the energy use and emissions data from its most important (largest) downstream transportation systems (road tankers and the Iraq/Türkiye oil pipeline applicable to our production in the Kurdistan region of Iraq). Therefore, there has been little purpose for DNO to evaluate this category so far. We however, are planning to provide estimates for these emissions next year.

Processing of sold products

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

Until this year, DNO has been very focused on quantifying GHG emissions which it has direct control of and can most effectively reduce (thus Scope 1). DNO's oil and gas production and sales are a small percentage of global amount (less than 0.1%), and thus, DNO has limited influence on the global trends on processing of its oil and gas sold, associated GHG emissions and mitigation technologies and strategies implemented by global refiners and processors. Despite these, DNO is aware of its scope 3 emissions, the part of which is from processing (refining) and transportation of our sold products (the oil and gas we produce). DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Use of sold products

(7.8.1) Evaluation status

Select from:

Relevant, not yet calculated

(7.8.5) Please explain

Until this year, DNO has been very focused on quantifying GHG emissions which it has direct control of and can most effectively reduce (thus Scope 1). DNO's oil and gas production and sales are a small percentage of global amount (less than 0.1%), and thus, DNO has limited influence on the global trends on use of its oil and gas production, associated GHG emissions and mitigation technologies and strategies. Despite these, DNO is aware of its scope 3 emissions, majority of which is associated with use of sold products. DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

End of life treatment of sold products

(7.8.1) Evaluation status

Select from:

Not relevant, explanation provided

(7.8.5) Please explain

Our sold products (crude oil and gas) are most likely combusted, therefore, "end of life treatment of sold products" is unlikely to apply to us. We have no way of reliably estimating how much of our hydrocarbon production is not combusted and thus may need end-of-life treatment. DNO will disclose estimates for these emissions next year (reporting year 2024) as part of its sustainability reporting under EU's Corporate Sustainability Reporting Directive (CSRD).

Downstream leased assets

(7.8.1) Evaluation status

Select from:

Not relevant, explanation provided

(7.8.5) Please explain

DNO does not have any downstream leased assets.

Franchises

(7.8.1) Evaluation status

Select from:

Not relevant, explanation provided

(7.8.5) Please explain

DNO does not have any franchise activities.

Investments

(7.8.1) Evaluation status

(7.10) How do your gross global emissions (Scope 1 and 2 combined) for the reporting year compare to those of the previous reporting year?

Select from:

Decreased

(7.10.1) Identify the reasons for any change in your gross global emissions (Scope 1 and 2 combined), and for each of them specify how your emissions compare to the previous year.

Change in renewable energy consumption

(7.10.1.1) Change in emissions (metric tons CO₂e)

645

(7.10.1.2) Direction of change in emissions

Select from:

Decreased

(7.10.1.3) Emissions value (percentage)

0.11

(7.10.1.4) Please explain calculation

*We installed solar PV panels in our operations in Kurdistan in 2023 which we estimate can produce around 261 MWh of emissions-free ("green") electricity per year (based on number of panels installed and average solar availability). Annual emissions savings are estimated to be around 645 tCO₂e. Our scope 12 GHG emissions in 2022 were 581,006 tCO₂e. Therefore, "Emissions value in percentage" was $645/581,006 * 100\% = 0.11$ percent*

Other emissions reduction activities

(7.10.1.1) Change in emissions (metric tons CO₂e)

15047

(7.10.1.2) Direction of change in emissions

Select from:

Decreased

(7.10.1.3) Emissions value (percentage)

2.59

(7.10.1.4) Please explain calculation

*DNO continued with its GHG reduction activities in its operated assets in 2023, notably In the Tawke license (which accounted for 69% of DNO's scope 1 emissions in 2023). As explained in section 7.55.2, we implemented four GHG reduction projects in 2023 in Tawke license (plus one solar PV project which is explained in the above row), Total annual GHG savings of these four projects are estimated to be 15,047 tCO₂e. Please note that these projects were commissioned throughout 2023 and GHG savings figure presented here are for the full year. Our scope 12 GHG emissions in 2022 were 581,006 tCO₂e. Therefore, "Emissions value in percentage" was $15,047/581,006*100\%2.59$ percent*

Divestment

(7.10.1.1) Change in emissions (metric tons CO₂e)

(7.10.1.2) Direction of change in emissions

Select from:

Decreased

(7.10.1.3) Emissions value (percentage)

54.69

(7.10.1.4) Please explain calculation

*Our operated production in 2023 totalled 16,972,330 barrels of oil equivalent (boe), a decrease of 57% versus year 2022 (39,287,505 boe). The change in our operated production was mainly driven by the shut-in of the Iraq-Türkiye oil export pipeline which led to reduction in activities and production in our licenses in Kurdistan region of Iraq. Our scope12 emissions in 2023 totalled 247,574 tCO2e. This figure was 581,006 tCO2e in 2022. Therefore, the total change in our scope 12 emissions from 2022 to 2023 was negative 333,432. Excluding other factors explained in this question (“Change in Renewable Energy Consumption” which led to an estimated decrease of 645 tCO2e and “Other Emissions Reduction Activities” which led to an estimated decrease of 15,047 tCO2e), we estimate that “Change in Output” led to a decrease in scope2 12 emissions of 333,432-645-15047 317,740 tCO2e in 2023. Our scope 12 GHG emissions in 2022 were 581,006 tCO2e. Therefore, “Emissions value in percentage” was $317,740/581,006*100\%$ 54.69 percent*

Change in methodology

(7.10.1.1) Change in emissions (metric tons CO2e)

0

(7.10.1.2) Direction of change in emissions

Select from:

No change

(7.10.1.3) Emissions value (percentage)

0

(7.10.1.4) Please explain calculation

Note that in 2023 we improved quantification of GHG emissions from flaring of associated gas in our Tawke license (containing both Tawke and Peshkibir fields). Tawke license flaring emissions are driven by associated gas production from the Peshkibir field. However, due to complexity of our operations and facilities, we have quantified the net effect of this change in methodology and change in production and flaring effects under the category “change in output”.

(7.23) Is your organization able to break down your emissions data for any of the subsidiaries included in your CDP response?

Select from:

Yes

(7.23.1) Break down your gross Scope 1 and Scope 2 emissions by subsidiary.**Row 1**

(7.23.1.1) Subsidiary name

DNO Iraq AS

(7.23.1.2) Primary activity

Select from:

Oil & gas extraction

(7.23.1.3) Select the unique identifier you are able to provide for this subsidiary

Select all that apply

No unique identifier

(7.23.1.12) Scope 1 emissions (metric tons CO2e)

231438

(7.23.1.13) Scope 2, location-based emissions (metric tons CO2e)

283

(7.23.1.14) Scope 2, market-based emissions (metric tons CO2e)

0

(7.23.1.15) Comment

This relates to scope 1 and scope 2 (location-based only, market based data are not available) emissions in year 2023 for our largest subsidiary, DNO Iraq AS (thus accounts for gross emissions from all of our activities in the Kurdistan region of Iraq). This subsidiary accounted for 94% of our scope 1 (and scopes 12) emissions in 2023.

[Add row]

(7.24) Report your methane emissions as percentages of natural gas and hydrocarbon production or throughput.

Row 1

(7.24.1) Oil and gas business division

Select all that apply

Upstream

(7.24.2) Estimated total methane emitted expressed as % of natural gas production or throughput at given division

1

(7.24.3) Estimated total methane emitted expressed as % of total hydrocarbon production or throughput at given division

0

(7.24.4) Indicate whether your methane emissions figure is based on observational data

Select from:

Both observational data and estimated or modelled data

(7.24.5) Details of methodology

Our methane emissions in 2023 (due to venting and fugitive emissions as uncombusted methane emitted during combustion/ flaring of hydrocarbons) were 14,177 tCO₂e, which is equivalent to 506 tCH₄, 25 million standard cubic feet (MMscf), or 0.0041 million barrels of oil equivalent (MMboe). The only operated assets of DNO in 2023 which produced gas were the Tawke and Baeshiqra licenses in the Kurdistan region of Iraq. All gas produced in these licenses were either injected back to the reservoir, combusted onsite (for heat and electricity generation) or flared. Associated gas produced in the Tawke and Baeshiqra licenses in 2023 totalled 4,886 MMscf. Therefore, the ratio of DNO's total methane emissions as %of natural gas production was: 25/4,8860.51%, which we have rounded to 1%. DNO's operated hydrocarbon production and sales in 2023 was from its operation in Kurdistan region of Iraq, which totalled 16.97 million barrels of oil equivalent. Therefore, the ratio of our total methane emissions as % of total hydrocarbons produced and sold was: 0.0041/16.970.02% which we have rounded to 0%.

[Add row]

(7.29) What percentage of your total operational spend in the reporting year was on energy?

Select from:

More than 0% but less than or equal to 5%

(7.30.7.2) Total fuel MWh consumed by the organization

301611

(7.30.7.3) MWh fuel consumed for self-generation of electricity

282608

(7.30.7.4) MWh fuel consumed for self-generation of heat

19003

(7.30.7.8) Comment

This category includes use of diesel and naphtha as fuel in our operations. DNO uses diesel in its Kurdistan operations for process heat, electricity generation, and mechanical energy (e.g., drilling rigs). The majority of diesel use is for electricity generation; therefore, for the sake of simplicity, we have assumed all diesel used in Kurdistan is for electricity generation. All of naphtha use is for process heat. Note that DNO uses relatively small amount of petrol for office vehicles (1,553 MWh in 2023). This was not included here because CDP does not have a category “transportation” for fuel use in this question.

(7.38.1) Explain which listing requirements or other methodologies you use to report reserves data. If your organization cannot provide data due to legal restrictions on reporting reserves figures in certain countries/areas, please explain this.

DNO's reserves and resources reporting is in accordance with standard guidelines advised by the Society of Petroleum Engineers (SPE) and comply with Oslo Stock Exchange disclosure requirements, Circular No. 1/2013. Reported reserves fall within class 1 to 3 of the Norwegian Petroleum Directorate (NPD) classification and contingent resources (2C) fall within class 4 to 7 of the NPD classification. The estimation and auditing of reserves are undertaken in accordance with generally accepted engineering and evaluation principles. It should be noted that reserves information is imprecise due to inherent uncertainties in—and the limited nature of—data upon which the reserves are predicated. DNO has a reserves and resources review committee consisting of competent professional geoscientists, engineers and economists to facilitate the review and reporting process and ensure compliance with standards and procedures. The committee collects and coordinates the review of all technical data and provides a full report of the Company's reserves and resources to the CEO (or what we refer to in DNO terminology as the Managing Director or MD) for review and approval. Economically recoverable reserves have been calculated based on input for the technical reserves and economic parameters such as license terms and projected future oil and gas prices. The reserves reported are restricted to those volumes expected to be economically recovered prior to the expiry date of the respective licenses. International petroleum consultants DeGolyer and MacNaughton (D & M) carried out an independent assessment of the Tawke license (containing the Tawke and Peshkibir fields) and the Baeshiqa license (containing the Baeshiqa and Zartik structures) in the Kurdistan region of Iraq. International petroleum consultants RPS Energy Consultants (RPS) carried out an independent assessment of DNO reserves in Norway and the United Kingdom (UK). Contingent resources in Norway are reported based on numbers published by Norwegian Offshore Directorate (NOD). DNO had no contingent resources in the UK at yearend 2023. The International petroleum consultants Beicip-Franlab carried out an independent assessment of DNO's licenses (held through its indirect 33.33 percent interest in the operating entity) in Côte d'Ivoire. The Company internally assessed volumes reported for its Block 47 in Yemen. For more details on reserves and resources, see company's website: <https://www.dno.no/media/wa5fqypi/annual-statement-of-reserves-and-resources-2023-1.pdf>

(7.45.7) Direction of change

Select from:

Decreased

(7.45.8) Reasons for change

Select all that apply

Other emissions reduction activities

Change in output

Change in revenue

(7.45.9) Please explain

Our absolute emissions in 2023 (scope 12) stood at 247,574 tCO₂e, which was 57% lower than of year 2022 (581,006 tCO₂e). Our revenues in 2023 were USD667.5 million, compared to 1,377 million in 2022, which is a decrease of 52%. Our emissions intensity in 2023 was therefore 0.000371 compared to 0.000422 in 2022 (tCO₂e/USD) Therefore, the net change in emissions intensity was a decrease of 12%.
[Add row]

(7.48) Provide the intensity figures for Scope 1 emissions (metric tons CO₂e) per unit of hydrocarbon category.

Row 1

(7.48.1) Unit of hydrocarbon category (denominator)

Select from:

Thousand barrels of crude oil/ condensate

(7.48.2) Metric tons CO₂e from hydrocarbon category per unit specified

14.6

(7.48.3) % change from previous year

1

(7.48.4) Direction of change

Select from:

Decreased

(7.48.5) Reason for change

Our absolute scope 1 emissions in 2023 stood at 247,191 tCO₂e, which was 57% lower than of year 2022 (580,636 tCO₂e). This was mainly due to reduction in activities and production in our core area of production (Kurdistan region of Iraq), in addition to various emissions reduction efforts delivered by the company in 2023. Our operated production in 2023 (16,972,330 barrels of oil equivalent, boe) decreased by 57% compared to 2022 (39,286,232 boe), which was driven mainly by reduction in activities and production in our core area of production (Kurdistan region of Iraq) due to the shut-in of the export pipeline for most of 2023. Our emissions intensity in 2023 was therefore 14.6 kgCO₂e/boe in 2023, compared to 14.8 kgCO₂e/boe in 2022, a reduction of 1% (rounded). This was net effect of reduced activities in our core area of production (Kurdistan region of Iraq) and various GHG reduction projects, including flare reduction.

(7.48.6) Comment

Achieved and maintained

(7.53.1.82) Explain target coverage and identify any exclusions

DNO commenced development of the Peshkabir field in the Tawke license in the Kurdistan region of Iraq in 2017 and production of the field was significant by 2019. As is typical in this region, associated gas was initially planned to be flared. However, the oil produced at Peshkabir had higher than expected associated gas content.

Consequently, the Tawke license became by far the largest contributor (95%) to DNO's GHG emissions in 2019 (base year for this target), (599,207,059,207 tO2e in scope 12 emissions in 2019 from flaring, compared to DNO's total scopes 12 emissions of 632,026,147,163,497 tCO2e in 2019). For this reason, in 2019 a target was set for scopes 1 and 2 emissions at Tawke license to be reduced by at least two-third (66.67%) within five years (by 2024). The target was set for this facility (the Tawke license) as it is the largest source of DNO's emissions across its global portfolio. Math behind flaring at the Tawke license being the largest (95%) contributor to DNO's scope 12 emissions in 2019: Flaring emissions at Tawke license in 2019: 599,207 tCO2e Total company's scopes 12 GHG emissions in 2019: 633,497 tCO2e Therefore, the ratio is 95%.

(7.53.1.83) Target objective

To materially reduce emissions from our main producing asset (Tawke license in Kurdistan region of Iraq), emissions of which were mainly due to flaring of associated gas in the base year (2019, when the target was set) and in future years without any mitigation actions. This target would allow us to achieve a GHG intensity far below the global upstream sector and maintain our position among peers as a low-cost, low carbon oil and gas company.

(7.53.1.85) Target derived using a sectoral decarbonization approach

Select from:

No

(7.53.1.86) List the emissions reduction initiatives which contributed most to achieving this target

To reduce flaring emissions and achieve this target, DNO planned and implemented a two-phase gas injection project in addition to multiple fuel switching projects (replacing diesel with gas). The first phase of the project (commissioned in 2020) involved capturing and processing associated gas produced at the Peshkibir field and pipelining it to the nearby Tawke field (within the same license). At the Tawke field, the transported gas is injected underground for reservoir pressure management. The cost of this project was USD 110 million. Phase 2 of the project was commissioned in early 2023 at a cost of about USD 25 million. The second phase aimed to capture and reinject into the Tawke field any associated gas produced at the Tawke field itself. Flaring GHG emissions in the Tawke license has reduced significantly due to both phases one and two of gas project being operational in 2023 in addition to various fuel switching projects (replacing diesel with otherwise flared associated gas). However, due to the significant reduction in production and activity in the Tawke license in 2023 (driven by the shut-in of the export pipeline for the majority of the year), gas production, and therefore gas processing, injection, and flaring, were below the forecasted volumes. In other words, while we achieved our target for absolute emissions in Tawke license in 2023, this was partly driven by lower activity (and gas production to start with). Therefore, we have maintained this target for year 2024 when we expect more normal operations (higher gas production compared to 2023 due to increased oil and gas production activities in the Tawke license).

(7.54.2.15) Is this target part of an emissions target?

No. This is a standalone target aiming to materially reduce (nearly zero) our methane emissions.

(7.54.2.16) Is this target part of an overarching initiative?

Select all that apply

Other, please specify :In 2022, DNO joined the Aiming for Zero Methane Emissions Initiative, an oil and gas industry pledge coordinated by the Oil and Gas Climate Initiative (OGCI), to reach near zero methane emissions from its operated oil and gas assets by 2030

(7.54.2.18) Please explain target coverage and identify any exclusions

DNO joined the Aiming for Zero Methane Emissions Initiative in 2022. This is an oil and gas industry pledge coordinated by the Oil and Gas Climate Initiative (OGCI), through which DNO set a target to reach near zero methane emissions from its operated oil and gas assets by 2030 and actively work with its partners in its non-operated assets to achieve the same. The target applies to all of DNO's operated assets (consistent with the reporting methodology of Operational Control). We are targeting 90% reduction compared to the base year.

(7.54.2.19) Target objective

To reduce our methane emissions (across all operated assets) materially (90% compared to the base year)

(7.54.2.20) Plan for achieving target, and progress made to the end of the reporting year

Despite this target being set in 2022, DNO already started with an LDAR (Leak Detection and Repair) program to identify and remediate fugitive methane emissions from its largest operated asset (Tawke license in Kurdistan region of Iraq). DNO is actively pursuing other options to help it achieve the 2030 goal. In 2023, we engaged with a specialized firm to improve quantification and reporting of DNO's methane emissions. We are also considering joining industry expert groups for knowledge and best-practice sharing and action for methane reduction.

(7.55.2.9) Comment

The Central Production Facility (CPF) at the Tawke field (in our operations in the Kurdistan region of Iraq) consists of several production and processing trains. In 2023 and as result of installing new equipment, we were able to turn off (retire) some less efficient oil processing units and instead direct the oil through more efficient processing units ("front-end water separators"). The heating energy demand of the new equipment is satisfied partly via waste heat recovery. Heating load of the old units were supplied by direct combustion of diesel. We expect this change in processing equipment and resulting waste heat recovery to save about 15 barrels of heating fuel (diesel) per day. At unit price of USD 0.5 per liter (about USD 77 per barrel) of diesel, this is a savings of about USD 421 thousand per year. Total cost to achieve this GHG savings was about USD 100 thousand. Therefore, the payback time is less than one year. The savings from this project are expected to last until end of the production license (2036).

(7.55.2.9) Comment

Most of our oil production wells in our Tawke license (in the Kurdistan region of Iraq) are equipped with electricity-driven pumps (called Electrical Submersible Pumps, ESP) to bring oil from the reservoir to the surface. Electricity is produced onsite via diesel-run generators. In 2023, DNO replaced generators at 11 well sites with more efficient units (smaller and with higher reliability). Retiring older and larger generators with newer, smaller and more efficient generators lead to more efficient use of fuel (diesel in this case). We estimate this improvement to save about 7 barrels of fuel (diesel) per day with GHG savings of about 1,100 tCO₂e per year. At diesel cost of USD 0.5 per liter of diesel (about USD 77 per barrel), this is a savings of about USD 197 thousand per year. Total cost to achieve this GHG savings was about USD 362 thousand. Therefore, the payback time is less than two years. The savings from this project are expected to last for lifetime of generators, which is around five years.

(7.55.2.9) Comment

Oil processing facility at the Peshkibir field (in our operations in the Kurdistan region of Iraq) requires an additional 14 megawatts of thermal load from 2023. Original design of processing units was based on combustion of diesel to meet this thermal load. DNO changed the design to use otherwise-flared rich fuel gas instead of burning diesel. We expect this change in heating fuel to save about 265 barrels of diesel per day. At unit price of USD 0.5 per liter (about USD 77 per barrel) of diesel, this is a savings of about USD 7.4 million per year. Total cost to achieve this GHG savings was about USD 630 thousand. Therefore, the payback time is less than one year. The savings from this project are expected to last until end of the production license (2036).

(7.55.2.9) Comment

DNO installed solar arrays in a remote location (warehouse in Peshkibir field in Kurdistan), electricity of which (and a neighbouring building) was previously supplied by onsite diesel-fueled generators. The PV solar panels are expected to produce about 261 MWh of electricity per year (which otherwise would have been produced via combustion of diesel). We expect this change in heating fuel to save about 4 barrels of diesel per day. At unit price of USD 0.5 per liter (about USD 77 per barrel) of diesel, this is a savings of about USD 112 thousand per year. Total cost to achieve this GHG savings was about USD 400 thousand. Therefore, the payback time is slightly over three years. The savings from this project are expected to last until end of the production license (2036).

Row 5

(7.55.2.1) Initiative category & Initiative type

Low-carbon energy generation

(7.55.2.9) Comment

DNO installed a single 33 kilovolts (kV) power cable to distribute power to all well sites in our Peshkabir field in the Kurdistan region of Iraq. These well sites were previously powered by onsite diesel-fueled generators. This transmission line allow delivery of more efficiently generated electricity from a central generator (more efficient operations rather than running several generators at partial load). We expect this project to save about 2 barrels of diesel per day. DNO installed a single 33 kilovolts (kV) power cable to distribute power to all well sites in our Peshkabir field in the Kurdistan region of Iraq. These well sites were previously powered by onsite diesel-fueled generators. This transmission line allows delivery of more efficiently generated electricity from a central generator (more efficient operations rather than running several generators at partial load). We expect this project to save about 2 barrels of diesel per day. At unit price of USD 0.5 per liter (about USD 77 per barrel) of diesel, this is a savings of about USD 56 thousand per year. Total cost to achieve this GHG savings was about USD 3.6 million. The breakeven timeline is then more than 30 years (3.6 million divided by 56 thousand).

[Add row]

(7.57) Describe your organization's efforts to reduce methane emissions from your activities.

In 2023, we also engaged with a third-party technical firm to review our methane quantification methodology and improve our coverage, accuracy and transparency. In 2023, DNO also joined the Methane Guiding Principles (MGP, <https://methaneguidingprinciples.org/>), a coalition of industry and civil society organizations to reduce methane emissions across the oil and gas global supply chain. The MGP members develop and share practical tools and guidance to help others to learn from their experience and put those lessons into practice. Earlier in 2022, DNO joined the Aiming for Zero Methane Emissions Initiative which is oil and gas industry pledge coordinated by the Oil and Gas Climate Initiative (OGCI), to reach near zero methane emissions from its operated oil and gas assets by 2030 and actively work with its partners in its non-operated assets to achieve the same.

(7.61) Does your organization conduct leak detection and repair (LDAR) or use other methods to find and fix fugitive methane emissions from oil and gas production activities?

Select from:

Yes

(7.61.1) Describe the protocol through which methane leak detection and repair or other leak detection methods, are conducted for oil and gas production activities, including predominant frequency of inspections, estimates of assets covered, and methodologies employed.

Gas leaks (which include methane) are not acceptable in any of DNO's operations due to the safety risk (risk of fire or explosion) they represent. In addition, the gas we handle in our Kurdistan operations contains Hydrogen Sulphide (H₂S) which is very toxic if inhaled. Therefore, DNO has automatic gas (including methane and H₂S) leak detection sensors at all of its relevant facilities. These devices are complemented by the audio/visual/olfactory observations of the production operators. As such, any non-routine methane emission from a loss of containment will be detected within seconds and mitigating action taken immediately. Hence, the only

methane emissions at DNO facilities will be “micro” emissions (called fugitive methane emissions here) through, for example, screwed fittings and instruments, that are so small that they don’t trigger the automatic detectors. DNO introduced a Leak Detection and Repair (LDAR) program in 2022 to measure, monitor and mitigate fugitive (aka residual) methane emissions at its operated sites. This initiative was announced by DNO's Executive Chairman of the Board of Directors. On a quarterly basis, all relevant locations in DNO’s largest asset (Tawke license in the Kurdistan region of Iraq) are scanned as part of the LDAR program for fugitive methane emissions. All findings are recorded in our online system, emissions are quantified and remediation (including repairs) plans are put in place and reported to the management. DNO has an active LDAR program in 2023.

(7.62) If flaring is relevant to your oil and gas production activities, describe your organization’s efforts to reduce flaring, including any flaring reduction targets.

Yes, flaring of associated gas is relevant to DNO’s operations in Kurdistan region of Iraq (onshore) but not to its North Sea (offshore Norway and the UK) operations. In Kurdistan, the most important flare reduction project that we have successfully completed in 2023 was transfer of associated gas from the Peshkibir field, which was being flared previously, to the nearby Tawke field for underground injection. Phase 1 of the project was completed in 2020. Phase 2 of the associated gas capture and injection project (instead of flaring) was commissioned in early 2023 at a total cost of about USD 25 million. This phase aims to capture and reinject any associated gas produced at the Tawke field back into the Tawke field. In terms of target (and as also described in Section 7.53.1): DNO in 2019 set a target for its Tawke license GHG emissions to be reduced by at least two-third (66.67%) within five years (by end 2024). The target coverage was set for the Tawke license as it is the largest source of DNO’s scope 1 emissions (598,222/632,51295%) in 2019. Going forward, DNO expects flaring emissions in the Tawke license will drop significantly due to phase 1 and 2 of gas injection project that we fully delivered in early 2023. Although very uncertain (depending on reservoir performance), we forecast that in 2024, on an average, 27 MMscf (million standard cubic feet) per day of otherwise flared associated gas will be injected. This compares to daily average of 22.1 MMscf flaring of associated gas in 2019 (and injection of zero).

(7.74) Do you classify any of your existing goods and/or services as low-carbon products?

Select from:

No

(7.79) Has your organization canceled any project-based carbon credits within the reporting year?

Select from:

No

Select from:

Yes

(9.1.1) Provide details on these exclusions.

Row 1

(9.1.1.1) Exclusion

Select from:

Other, please specify :DNO offices in UAE, Iraq, Norway and the UK due to insignificant water use

(9.1.1.2) Description of exclusion

In 2023, DNO had one office in Dubai (UAE), one office in Erbil (Iraq), one office in Aberdeen (the UK), one office in Oslo (Norway) and one office in Stavanger (Norway). Water withdrawal, water use and water discharge at these offices is not included in this disclosure because they are estimated to be trivial (less than 0.5%) compared to our total water withdrawal, water use and water discharge from our field operations. Additionally, these offices do not have separate water meters (inside large buildings). Note that water withdrawal, water use and water discharge from all of our field facilities are included in this disclosure (which accounts for over 99.5% of our water withdrawal, water use and water discharge).

(9.1.1.3) Reason for exclusion

Select from:

Shared premises

(9.1.1.7) Percentage of water volume the exclusion represents

Select from:

Less than 1%

(9.1.1.8) Please explain

Water withdrawal, water use and water discharge from all of our field facilities and operations are included in this disclosure. What is excluded is water withdrawal, water use and water discharge in our offices (office staff) which we have estimated to be very insignificant (less than 0.5%) compared to water withdrawal, water use and water discharge in our field facilities.

[Add row]

(9.2) Across all your operations, what proportion of the following water aspects are regularly measured and monitored?

Water withdrawals – total volumes

(9.2.1) % of sites/facilities/operations

Select from:

100%

(9.2.2) Frequency of measurement

Select from:

Daily

(9.2.3) Method of measurement

Measurement method varies across facilities; we use water meters (flowmeters), tank level readings, and weighbridges (to weigh road tankers supplying water to some of our field facilities in Kurdistan region of Iraq)

(9.2.4) Please explain

We have operations in three countries/ regions: Norway, the UK and Kurdistan region of Iraq. In Kurdistan (Iraq). In Kurdistan (onshore), we monitor and measure water withdrawals from a nearby river and from DNO-operated water wells. We also procure water from third-parties (via road tankers), volumes of which are monitored and measured. All volume measurements are done on a daily basis. In Norway and the UK (offshore) water is supplied to our drilling rigs from the shore through third-party vessels. In addition to this, some water is withdrawn from the sea. These volumes are measured when required by the relevant regulations or internal standards. When a measurement is required, they are done at the required frequency (often daily).

Water withdrawals – volumes by source

(9.2.3) Method of measurement

We use water meters (flowmeters) to measure quantity of produced water

(9.2.4) Please explain

We measure (via flowmeters) the quantity of the produced water in all of our oil and gas operations. This is done on a continuous basis (and reported on a daily basis).

Water withdrawals quality

(9.2.1) % of sites/facilities/operations

Select from:

76-99

(9.2.2) Frequency of measurement

Select from:

Yearly

(9.2.3) Method of measurement

In our operations in the Kurdistan region of Iraq, which account for the majority of our water use, we use external labs to test for chemical parameters and our own lab for biological parameters. In our operations in Norway and the UK, external labs are used to test for relevant parameters depending on operational needs and applicable regulations. The frequency of measurement is at least once a year or at intervals required by the relevant regulations.

(9.2.4) Please explain

We have operations in three countries/ regions: Norway, the UK and Kurdistan region of Iraq: In Kurdistan (onshore), we have two licenses: Tawke and Baeshiqa: Tawke license: we test quality of water we withdraw from a nearby river as well as from DNO-operated water wells in addition to water delivered by third parties. These tests were done two times in 2023. Baeshiqa license: We monitor and test quality of water withdrawn from DNO-operated wells in addition to water delivered by third-parties. This was done one time in 2023. In addition to Kurdistan, DNO has operations in offshore Norway and the UK. No testing of water quality was required by applicable regulations and industry practices for our activities in these countries in 2023. This is why we have chosen 76-99% (and not 100).

Water discharges – total volumes

(9.2.1) % of sites/facilities/operations

Select from:

100%

(9.2.2) Frequency of measurement

Select from:

Daily

(9.2.3) Method of measurement

Discharge volumes are quantified through combination of flowmeters and water tank level readings.

(9.2.4) Please explain

As per CDP definition of “discharge”, the only relevant category to our operations in 2023 was occasional discharge of water to sea in our offshore operations in the UK and Norway. Such discharges (quality and quantity) are monitored and reported when required by the applicable regulations and internal standards. Note that sewage is not included in our reported volumes, consistent with the CDP guidelines, as we estimate the volumes to be relatively small (less than 5% of total water withdrawal).

Water discharges – volumes by destination

(9.2.3) Method of measurement

Discharge volumes are quantified through combination of flowmeters and water tank level readings.

(9.2.4) Please explain

As per CDP definition of “discharge”, the only relevant category to our operations in 2023 was occasional discharge of water to sea in our offshore operations in the UK and Norway. Such discharges (quality and quantity) are monitored and reported when required by the applicable regulations and internal standards. Note that sewage is not included in our reported volumes, consistent with the CDP guidelines, as we estimate the volumes to be relatively small (less than 5% of total water withdrawal).

Water discharge quality – by standard effluent parameters

(9.2.1) % of sites/facilities/operations

Select from:

Not relevant

(9.2.4) Please explain

As per CDP definition of “discharge”, the only water discharge category relevant to our operations in 2023 was occasional discharge of water to the sea in our offshore operations in the UK and Norway. Such discharges (quality and quantity, including any treatment required to meet the specifications for discharge) are monitored, measured and reported when required by the applicable environmental and oil and gas regulations and internal standards. Measuring the quality of discharge water for our operations in 2023 was not required by relevant regulations and industry practices and standards therefore, we have chosen “not relevant”.

Water discharge quality – emissions to water (nitrates, phosphates, pesticides, and/or other priority substances)

(9.2.1) % of sites/facilities/operations

Select from:

Not relevant

(9.2.4) Please explain

As per CDP definition of “discharge”, the only water discharge category relevant to our operations in 2023 was occasional discharge of water to the sea in our offshore operations in the UK and Norway. Such discharges (quality and quantity, including any treatment required to meet the specifications for discharge) are monitored, measured and reported when required by the applicable environmental and oil and gas regulations and internal standards. Measuring the quality of discharge water for our operations in 2023 was not required by relevant regulations and industry practices and standards therefore, we have chosen “not relevant”.

Water discharge quality – temperature

(9.2.1) % of sites/facilities/operations

Select from:

Not relevant

(9.2.4) Please explain

As per CDP definition of “discharge”, the only water discharge category relevant to our operations in 2023 was occasional discharge of water to the sea in our offshore operations in the UK and Norway. Such discharges (quality and quantity, including any treatment required to meet the specifications for discharge) are

monitored, measured and reported when required by the applicable environmental and oil and gas regulations and internal standards. Measuring the temperature of discharge water in our 2023 operations was not required by relevant regulations and industry practices and standards therefore, we have chosen "not relevant".

Water consumption – total volume

(9.2.1) % of sites/facilities/operations

Select from:

100%

(9.2.2) Frequency of measurement

Select from:

Daily

(9.2.3) Method of measurement

Measurement method varies across facilities; we use water meters (flowmeters), tank level readings, and weighing road tankers used for water delivery.

(9.2.4) Please explain

We monitor and quantify our total water consumption through measuring our water withdrawals and discharges. Our water consumption is calculated from the formula below: $Total\ consumption = Total\ Withdrawal - Total\ Discharge$. Quantification/ measurement frequency is daily (consistent with daily measurement of withdrawal and discharge volumes) for our Kurdistan operations which accounts for 99.6% of our water consumption. The balance refers to water use offshore Norway and the UK which are quantified for each relevant operation (frequency can vary depending on the duration of the project. Note that environmental regulations applicable to oil and gas operations offshore Norway and the UK, which DNO is subject to, are among the most stringent in the world).

Water recycled/reused

(9.2.1) % of sites/facilities/operations

Select from:

Not relevant

(9.2.4) Please explain

This category was not relevant to DNO in 2023. In the Kurdistan region of Iraq, there are currently no water recycling facilities available to DNO. In Norway and the UK, DNO did not have any operations in 2023 which involved reuse/ recycle of water.

The provision of fully-functioning, safely managed WASH services to all workers

Increase/decrease in business activity

(9.2.2.4) Five-year forecast

Select from:

About the same

(9.2.2.5) Primary reason for forecast

Select from:

Other, please specify :Going forward, we do not expect this number to change significantly although providing an accurate forecast is challenging because our water demand is driven mainly by our activity level, which itself can change year-to-year.

(9.2.2.6) Please explain

Total water withdrawn across our business in 2023 was 490 mega liters, compared to 530 mega liters in 2022. The decrease was 7.5% and therefore we have chosen "Lower" both due to the percentage change (-7.5%) and more importantly, the amount of the decrease, which was 40 mega liters. The decrease was driven mainly by lower activity (notably drilling operations) in our Kurdistan licenses. Going forward, we do not expect this number to change significantly although providing an accurate forecast is challenging because our water demand is driven mainly by our activity level, which itself can change year-to-year. This is because our activity level is a function of both DNO-specific factors (e.g., reservoir performance, thus need for less/more drilling) and external factors (e.g., global oil demand and price, access to markets).

Total discharges

Other, please specify :Going forward, we do not expect this number to change significantly although providing an accurate forecast is challenging because our water discharge is driven mainly by our activity level, which itself can change year-to-year.

(9.2.2.6) Please explain

Our total water discharge in 2023, which was 7.1 mega liters did not change materially on absolute terms compared to 2022 (which stood at 6.5 mega liters), considering the scale of our water withdrawal figure (490 mega liters in 2023). Due to the small change (0.6 mega liters) in absolute terms, we have chosen "About the same". It is of note that the relative (percentage) change was 10%; however, because the increase was insignificant compared to our total water withdrawal (0.7 mega liters compared to 490 mega liters), we have chosen "about the same". We do not expect this number to change significantly (in absolute terms) in near future.

WRI Aqueduct

(9.2.4.9) Please explain

DNO has a second license in the Kurdistan region of Iraq, called the Baeshiqa license. This license is in early phases of development thus water demand is insignificant compared to the Tawke license. Using the WRI Aqueduct platform and selecting the "Water Stress" criterion, this license is in the "Medium High" (20-40%) category. Total water withdrawal in our Kurdistan operations was 481 mega liters in 2023, which was lower than 522 mega liters in 2022, a decrease of 7.9% (therefore, we have chosen "Lower" as the trend in water withdrawal). The decrease in water withdrawal was driven mainly by lower field activity (mainly drilling) in 2023. It is of note that we have not experienced any shortage of water impacting our operations in Kurdistan region of Iraq. The volume of water flowing through our nearby river is very much larger than our water withdrawals. Water wells have also been performing strongly and we do not have concerns over water availability in the foreseeable future. For DNO's operations in offshore Norway and the UK, the WRI tool marks both areas as no/little risk which is consistent with our experience (no shortage of water whatsoever). Water is not considered a scarce resource in neither Norway nor the UK.

[Fixed row]

(9.2.7) Provide total water withdrawal data by source.

Fresh surface water, including rainwater, water from wetlands, rivers, and lakes

(9.2.7.1) Relevance

(9.2.7.4) Primary reason for comparison with previous reporting year

Select from:

Increase/decrease in business activity

(9.2.7.5) Please explain

This relates to water sourced from a nearby river used in our Tawke field operations in the Kurdistan region of Iraq (onshore). Total volume in 2023 was 210 mega liters, which was marginally higher by only 1.9% (essentially unchanged) compared to the 2022 volumes of 206 mega liters. Due to very small change, we have chosen “About the Same” to answer this question. The change in the net effect of change in business activity and changes in other water withdrawal categories relevant to our business in Kurdistan (water withdrawn from wells and supplied by third-parties).

Brackish surface water/Seawater

(9.2.7.1) Relevance

Select from:

Relevant

(9.2.7.2) Volume (megaliters/year)

5

(9.2.7.3) Comparison with previous reporting year

Select from:

Lower

(9.2.7.4) Primary reason for comparison with previous reporting year

Select from:

Increase/decrease in business activity

(9.2.7.5) Please explain

This relates to seawater used for our offshore operations in Norway and the UK. Change from 2022 (total of 7.8 mega liters) to 2023 (total of 4.6 mega liters) shows - in absolute term – a decrease of 3.2 mega liters, which is very small. Therefore, we have chosen “Lower” to answer this question.

Groundwater – renewable

(9.2.7.1) Relevance

Select from:

Relevant

(9.2.7.2) Volume (megaliters/year)

193

(9.2.7.3) Comparison with previous reporting year

Select from:

Higher

(9.2.7.4) Primary reason for comparison with previous reporting year

Select from:

Increase/decrease in business activity

(9.2.7.5) Please explain

This relates to water withdrawn from multiple DNO-operated water wells in our Tawke license (and at a much lower scale at our Baeshiqa license) in the Kurdistan region of Iraq (onshore). Our current view is that the groundwater is renewable based on historical performance of the water wells and our understanding of the regional geology and aquifer. The volumes in 2023 (193 mega liters) were “Higher” (by 45%) compared to the 2022 level (133 mega liters). This increase of 59 mega liters is the net effect of lower field activity (mainly drilling) and a much larger decrease in alternative water sources for our Kurdistan operations (total of withdrawals from river and third-parties decreased by 96 mega liters compared to an increase in this category of 59 mega liters).

Groundwater – non-renewable

(9.2.7.1) Relevance

Select from:

Not relevant

(9.2.7.5) Please explain

As per note above, our current assessment is that our withdrawal from groundwater is from renewable sources. Therefore, the non-renewable category is not applicable to us. We do not have any indications of any material change in this category within the foreseeable future.

Produced/Entrained water

(9.2.7.1) Relevance

Select from:

Not relevant

(9.2.7.5) Please explain

All produced water is injected back into the underground reservoir. Therefore, the figure does not need to be disclosed to understand DNO's water balance. We consider the figure confidential as it may be market sensitive information, and since it is not required to understand our water balance, we do not disclose it.

Third party sources

(9.2.7.4) Primary reason for comparison with previous reporting year

Select from:

Increase/decrease in business activity

(9.2.7.5) Please explain

We have operations both onshore and offshore. In Kurdistan (onshore), we acquire some water for our operations from third-party road tankers. In UK and Norway (offshore), we sometimes acquire water for our offshore drilling operations via third-party vessels. Total volumes supplied by third-parties across DNO's global operations in 2023 were 83 mega liters, which were 55% lower compared to the 2022 volumes (183 mega liters). This decrease was due to the net effect of lower field activity in 2023 and slightly higher levels of water supply in 2023 via other means (river and water wells). We have chosen "Lower" to answer trend in this category.

[Fixed row]

(9.2.8) Provide total water discharge data by destination.

Fresh surface water

(9.2.8.1) Relevance

Select from:

Not relevant

(9.2.8.5) Please explain

In 2023 and 2022, we did not discharge any water in this category. Therefore, this is not relevant to our company. We do not believe this will change in the foreseeable future.

(9.3) In your direct operations and upstream value chain, what is the number of facilities where you have identified substantive water-related dependencies, impacts, risks, and opportunities?

Direct operations

(9.3.1) Identification of facilities in the value chain stage

Select from:

Yes, we have assessed this value chain stage and identified facilities with water-related dependencies, impacts, risks, and opportunities

(9.3.2) Total number of facilities identified

1

(9.3.3) % of facilities in direct operations that this represents

Select from:

1-25

(9.3.4) Please explain

This risk relates to having to potentially halt oil production operations at our Tawke field (within the Tawke license in the Kurdistan region of Iraq) due to excessive seasonal river flowrates causing integrity risks to one of our oil pipelines which crosses a river. To mitigate this risk, DNO has performed a major upgrade to the physical protection measures at the river crossing over the last three years. Note that DNO operates two licenses in the Kurdistan region of Iraq, Tawke and Baeshiqa, both of which host multiple facilities such as oil processing units and pipelines. This risk relates to one of the pipelines within the Tawke license. We have therefore 1-25% of DNO's company-wide facilities. Note that any potential shut-in of operations due to this risk is deemed to last less than a week, therefore we do not expect this risk to have substantial effects on our annual production and revenues. Therefore, the effect on DNO's oil and gas production and associated revenues are estimated to be less than 1% (calculated based on the share of DNO's production that flows through this pipeline and the estimated time to repair or put in place alternative shipment routes).

Upstream value chain

(9.3.1) Identification of facilities in the value chain stage

Select from:

No, we have not assessed this value chain stage for facilities with water-related dependencies, impacts, risks, and opportunities, and are not planning to do so in the next 2 years

(9.3.4) Please explain

The bulk of our water withdrawal (76-99%) occurs in the northern part of the Kurdistan Region of Iraq at our Tawke license. The water demand of the Tawke license is met via a nearby river and multiple water wells in addition to occasional third-party tanker deliveries. We have not experienced any shortage of water impacting our operations in Kurdistan region of Iraq. The volume of water flowing through our nearby river is very much larger than our water withdrawals. Water wells have also been performing strongly and we do not have concerns over water shortage in the foreseeable future. DNO has operations also in offshore Norway and the UK, where water is not considered a stressed commodity. We do not believe that any of our facilities – in our direct operations and upstream value chain – have substantive water-related dependencies, impacts, risks and opportunities. Additionally, performing a reliable assessment for our upstream value chain is not reasonably possible due to the global nature of our value chain (a company with global operations relying on a complex and very diversified upstream value chain). Therefore, we are not planning to do so in the next two years (not a strategic and business priority).

[Fixed row]

(9.3.1.12) Oil & gas sector business division

Select all that apply

Upstream

(9.3.1.29) Please explain

This relates to an approximately 40 kilometer long pipeline which transports oil produced at our Tawke field (coordination of which is provided) in the Kurdistan region of Iraq to an oil export facility (Fish Khabour) in the Kurdistan region of Iraq. This pipeline does not use or discharge any water (only transports oil). This pipeline crosses a river which has experienced much higher flow rates in recent years, leading to increased integrity risks to the pipeline. DNO has conducted multiple asset integrity improvement projects to reduce the risk of pipeline damage and potential water pollution by this pipeline since 2020 (including in 2023). The tool and method used to assess the substantial financial and strategic impact of this risk is DNO's five-by-five matrix with two dimensions of probability (likelihood) and consequence. [Add row]

(9.5.3) Anticipated forward trend

Future trends: Providing reliable forecast of future trends is challenging partly because our activity level (thus water demand) can vary year to year (e.g., depending on how many wells we drill). More importantly, our revenues can significantly change year-to-year due to the commodity-nature of our products (oil and gas) which drive our revenues. We do not anticipate our water use to significantly change in the next five years, but we cannot predict our revenue trends.

[Fixed row]

(9.11) Do you calculate water intensity for your activities associated with the oil & gas sector?

Select from:

Yes

(9.11.1) Provide water intensity information associated with your activities in the oil & gas sector.

Row 1

(9.11.1.1) Business division

Select all that apply

Upstream

(9.11.1.2) Water intensity value (m3/denominator)

0.03

(9.11.1.3) Numerator: water aspect

Select from:

Total water withdrawals

(9.11.1.4) Denominator

Select from:

Barrel of oil equivalent

(9.11.1.5) Comparison with previous reporting year

Select from:

About the same

(9.11.1.6) Please explain

Our operated oil and gas production in 2023 (17 million barrels of oil equivalent, million boe) decreased by 57% compared to 2022 (39 million boe). This drop was driven by curtailment of our production in Kurdistan (Iraq) throughout 2023 due to the shut-in of the Iraq-Türkiye export pipeline for the majority of 2023. Our total water withdrawal in 2023 was 490 mega liters, which experienced a drop of 8% compared to year 2022 (523 mega liters). The decrease in water withdrawal was also mainly driven by lower field activity in our Kurdistan operations (less drilling). Therefore, our water intensity in 2023 was: $490/17$ 28.9 liters per barrels of oil equivalent (boe), rounded to 0.03 m³/boe. The comparable number for year 2022 was $530/39$ 13.5 liters per barrels of oil equivalent (boe), rounded to 0.01 m³/boe. The absolute change in our water intensity is small, 0.015 cubic meters per barrel of oil equivalent (boe) produced more in 2023 compared to 2022 (despite a larger percentage change from 2022 to 2023, which was over 100%). We have therefore, chosen “about the same” to describe the direction of change due to the relatively insignificant change in absolute terms. We could have chosen Higher or Much Higher too (in the absence of clear guidelines from CDP, we chose “About the Same” again due to the relatively small change in absolute terms). Internal use of the metrics: Monitoring and reducing water intensity has become more important to DNO’s management in the last three years (an example being DNO submitting this water disclosure starting for reporting year 2020). Also water usage, trends, and reduction efforts are reported to and discussed with DNO’s senior management. DNO has already put a water policy in place and is working on introducing Key Performance Indicators (KPIs) to benchmark its strategy and progress compared to the industry peers in the next two years. Additionally, we are working to further improve the accuracy of our water accounting which should help us in better forecasting our water intensity in future.

[Add row]

(9.13) Do any of your products contain substances classified as hazardous by a regulatory authority?

(9.13.1) Products contain hazardous substances

Select from:

No

(9.13.2) Comment

DNO's only product from its operated assets (scope of this disclosure) was crude oil in 2023. Crude oil in the processed form (i.e., ready for sales) is not classified as a hazardous material by the regulatory authorities applicable to DNO's operated assets in 2023.

[Fixed row]

(9.14) Do you classify any of your current products and/or services as low water impact?

(9.14.1) Products and/or services classified as low water impact

Select from:

No, and we do not plan to address this within the next two years

(9.14.3) Primary reason for not classifying any of your current products and/or services as low water impact

Select from:

Other, please specify :lack of clear definition of "low water impact" by CDP, see the "please explain" box

(9.14.4) Please explain

We could not find a clear definition from CDP on what "low-water" may mean other than: "Low water impact products and services refers to products/services that could be considered as having a lower detrimental impact on water resources, water quality and ecosystems than the market norm or than the company's previous products/services." Oil and gas production in general and particularly our operations, are not water-intensive (in contrast to e.g., food processing or textile) because our final product – crude oil – does not contain water (other than very small amounts, often less than 0.5%). Therefore, one could argue our product (oil) is low-water impact. However, we have not chosen this answer because it is currently very difficult to compare our water intensity to our oil and gas producing peers (limited availability of data in the industry on water use).

[Fixed row]

(9.15) Do you have any water-related targets?

Select from:

- No, but we plan to within the next two years

(9.15.3) Why do you not have water-related target(s) and what are your plans to develop these in the future?

(9.15.3.1) Primary reason

Select from:

- We are planning to introduce a target within the next two years

(9.15.3.2) Please explain

DNO has operations in three countries/ regions (Norway, the UK and the Kurdistan region of Iraq). In Norway and the UK, water is not considered a scarce commodity, especially in the context of our offshore oil and gas operations. In the Kurdistan region of Iraq, although Iraq is considered a water-stressed country as a whole, neither we nor the surrounding communities have experienced material water shortage in and around our areas of operations. Therefore, we do not deem water issues to be a business priority which require dedicated targets and goals at this stage. However, water-related issues, including its availability, have become more important to DNO's management and its stakeholders (e.g., regulators and local communities in the Kurdistan region of Iraq). Therefore, we are considering setting water-related targets and goals, especially to reduce the intensity of our fresh water use in our Kurdistan operations, within the next two years.

[Fixed row]

C10. Environmental performance - Plastics

(10.1) Do you have plastics-related targets, and if so what type?

	Targets in place
	<i>Select from:</i> <input checked="" type="checkbox"/> No, and we do not plan to within the next two years

[Fixed row]

C11. Environmental performance - Biodiversity

(11.2) What actions has your organization taken in the reporting year to progress your biodiversity-related commitments?

(11.2.1) Actions taken in the reporting period to progress your biodiversity-related commitments

Select from:

Yes, we are taking actions to progress our biodiversity-related commitments

(11.2.2) Type of action taken to progress biodiversity- related commitments

Select all that apply

Land/water protection

Land/water management

Species management

[Fixed row]

(11.3) Does your organization use biodiversity indicators to monitor performance across its activities?

	Does your organization use indicators to monitor biodiversity performance?
	Select from: <input checked="" type="checkbox"/> No, we do not use indicators, but plan to within the next two years

[Fixed row]

(11.4) Does your organization have activities located in or near to areas important for biodiversity in the reporting year?

Legally protected areas

(11.4.1) Indicate whether any of your organization's activities are located in or near to this type of area important for biodiversity

Select from:

No

(11.4.2) Comment

None of our operations in 2023 (onshore Kurdistan region of Iraq and offshore in Norway and the UK) were in proximity of Legally protected areas.

UNESCO World Heritage sites

(11.4.1) Indicate whether any of your organization's activities are located in or near to this type of area important for biodiversity

Select from:

No

(11.4.2) Comment

None of our operations in 2023 (onshore Kurdistan region of Iraq and offshore in Norway and the UK) were in proximity of UNESCO World Heritage sites.

UNESCO Man and the Biosphere Reserves

(11.4.1) Indicate whether any of your organization's activities are located in or near to this type of area important for biodiversity

Select from:

No

(11.4.2) Comment

None of our operations in 2023 (onshore Kurdistan region of Iraq and offshore in Norway and the UK) were in proximity of UNESCO Man and the Biosphere Reserves.

Ramsar sites

(11.4.1) Indicate whether any of your organization's activities are located in or near to this type of area important for biodiversity

Select from:

No

(11.4.2) Comment

None of our operations in 2023 (onshore Kurdistan region of Iraq and offshore in Norway and the UK) were in proximity of Ramsar sites.

Key Biodiversity Areas

(11.4.1) Indicate whether any of your organization's activities are located in or near to this type of area important for biodiversity

Select from:

No

(11.4.2) Comment

None of our operations in 2023 (onshore Kurdistan region of Iraq and offshore in Norway and the UK) are in proximity of Key Biodiversity Areas.

Other areas important for biodiversity

(11.4.1) Indicate whether any of your organization's activities are located in or near to this type of area important for biodiversity

Select from:

No

(11.4.2) Comment

None of our operations in 2023 (onshore Kurdistan region of Iraq and offshore in Norway and the UK) are in proximity of areas important for biodiversity.
[Fixed row]

C13. Further information & sign off

(13.1) Indicate if any environmental information included in your CDP response (not already reported in 7.9.1/2/3, 8.9.1/2/3/4, and 9.3.2) is verified and/or assured by a third party?

(13.1.1) Other environmental information included in your CDP response is verified and/or assured by a third party

Select from:

No, but we plan to obtain third-party verification/assurance of other environmental information in our CDP response within the next two years

(13.1.2) Primary reason why other environmental information included in your CDP response is not verified and/or assured by a third party

Select from:

Not an immediate strategic priority

(13.1.3) Explain why other environmental information included in your CDP response is not verified and/or assured by a third party

We are in process of establishing third-party verification for a broad range of our environmental disclosures as part of our reporting under the EU's Corporate Sustainability Reporting Directive (CSRD), starting from 2024.

[Fixed row]

(13.2) Use this field to provide any additional information or context that you feel is relevant to your organization's response. Please note that this field is optional and is not scored.

	Additional information
	<i>Not applicable</i>

[Fixed row]

(13.3) Provide the following information for the person that has signed off (approved) your CDP response.

(13.3.1) Job title

Managing Director

(13.3.2) Corresponding job category

Select from:

Chief Executive Officer (CEO)

[Fixed row]

(13.4) Please indicate your consent for CDP to share contact details with the Pacific Institute to support content for its Water Action Hub website.

Select from:

No
